# About This Guide

Uyuni enables you to efficiently manage a set of Linux systems and keep them up-to-date. It provides automated and cost-effective software management, asset management, system provisioning, and monitoring capabilities. Uyuni is compatible with {rh} Satellite Server and offers seamless management of both SUSE Linux Enterprise and Red Hat Enterprise Linux client systems.

# Solution Note: Uyuni Version Information

In this manual if not other specified, Uyuni version 3.2 is assumed and this version is required if a feature is discussed. Uyuni 3.2 and Uyuni 3.2 Proxy were originally released as a SLES 12 SP3 extension. Whenever features of the Uyuni3.2 host operating system are documented and not other specified version 12 SP3 is assumed.

This manual explains the features of the Web interface and is intended for Uyuni administrators and administrators with restricted roles for specific tasks. On certain topics we also provide background information, while some chapters contain links to additional documentation resources. The latter include additional documentation available on the installed system as well as documentation on the Internet.

For an overview of the documentation available for your product and the latest documentation updates, refer to Available Documentation (http://www.suse.com/documentation/suse-manager-3/)  $\checkmark$  or to the following section.

HTML versions of the manuals are also available from the Help menu of the Uyuni Web interface.

# Solution Note: Obtaining the Release Notes

Although this manual reflects the most current information possible, read the SUSE Manager Release Notes for information that may not have been available prior to the finalization of the documentation. The release notes can be found at SUSE Manager Release Notes (http://www.suse.com/documentation/suse-manager-3/) ⊿.

# 1 Available Documentation

The following manuals are available on this product:

#### Book "Getting Started"

Lists installation scenarios and example topologies for different Uyuni setups. Guides you step by step through the installation, setup and basic configuration of Uyuni. Also contains detailed information about Uyuni maintenance and troubleshooting.

#### **Reference Manual**

Reference documentation that covers the Web interface to Uyuni (Web UI).

#### Book "Best Practices"

Best practices on selected topics.

#### Book "Advanced Topics"

A collection of advanced topics not covered under the Best Practices Guide.

### 2 Feedback

Several feedback channels are available:

#### **Bugs and Enhancement Requests**

For services and support options available for your product, refer to http://www.suse.com/support/2.

To report bugs for a product component, go to https://scc.suse.com/support/requests ⊿, log in, and click **Create New**.

#### **User Comments**

We want to hear your comments about and suggestions for this manual and the other documentation included with this product. Use the User Comments feature at the bottom of each page in the online documentation.

#### Mail

For feedback on the documentation of this product, you can also send a mail to <docteam@suse.com(mailto:doc-team@suse.com) →>(mailto:doc-team@suse.de) →. Make sure to include the document title, the product version and the publication date of the documentation. To report errors or suggest enhancements, provide a concise description of the problem and refer to the respective section number and page (or URL).

# 3 Documentation Conventions

The following typographical conventions are used in this manual:

- /etc/passwd : directory names and file names
- placeholder: replace placeholder with the actual value
- PATH: the environment variable PATH
- ls, --help: commands, options, and parameters
- user : users or groups
- packagename : name of a package
- Alt , Alt F1 : a key to press or a key combination; keys are shown in uppercase as on a keyboard
- File > Save As, Cancel: menu items, buttons
- This paragraph is only relevant for the x86\_64 architecture. The arrows mark the beginning and the end of the text block.
   This paragraph is only relevant for the architectures <u>z Systems</u> and <u>POWER</u>. The arrows mark the beginning and the end of the text block.
- *Dancing Penguins* (Chapter *Penguins*, Another Manual): This is a reference to a chapter in another manual.

# 4 Special Uyuni Documentation Conventions

Additionally, the following typographical conventions are used in this manual:

• [*system\_type*]: This tag is used in chapter or section titles and indicates that this feature is only available for registered client of that system type. For example, these system types could appear in this context: [Management] (= clients registered via the traditional boot-strap method), [Salt] (= Salt minions), [Proxy], etc.

# 5 Overview and Navigation

### 5.1 Overview

This topic introduces you to the Uyuni Web UI. This section covers the *Main Menu > Home* menu. Entering the Uyuni URL in a browser leads you to the Sign In screen.

Before logging in, select [guimenu]``About, to browse and search for available documentation topics. You may reset your username and password from the *About* > *Lookup Login/Password* page. For more information, see *Section 6.7, "User Account"*.

### 6 Navigation

The top bar provides access to commonly used tools and user settings.

🗏 SUSE\_BManager > Home > Overview 🖡 👁 Q 💽 systems selected 🖉 🛓 admin 🔥 SUSE 📽 🕞

The right part of the top bar contains functionalities such as a bell icon with a counter bubble of unread notification messages, optionally, an eye icon with a context legend to the current page, quick search, links to background information, user preferences, and sign off. On the left is the so-called breadcrumb. The breadcrumb tells you how far you are from the root of the menu and it brings you back to any previous step.

The left navigation bar is the main menu to the Uyuni Web UI from where you load the Web UI pages. If you click a the label of a menu entry you either open that page, or, if it is just a container of sub-entries, it expands this part of the menu tree without actually loading a page. To collaps all open parts of the menu system, click the *Clear Menus* button at the top of menu, right to the <u>Search page</u> field. If you click the small circle icon on the right of a menu label,

the first available page of that menu entry will get loaded and displayed automatically. Enter a search string in the <u>Search page</u> field to find an entry of the menu tree. Available menu entries depend on the roles of the user.

Only Uyuni Administrators see the following navigation items:

- Main Menu > Images
- Main Menu > Users
- Main Menu > Admin

Some pages have tabs and subtabs. These tabs offer an additional layer of granularity in performing tasks for systems or users. The following example displays the tabs and subtabs available under System Details. Green bars underline active tabs.

 Defails
 Software
 Configuration
 Provisioning
 Groups
 Audit
 Events

 Overview
 Properties

# Important: Views Depending on User Roles

This guide covers the administrator user role level, some tabs, pages, and even whole categories described here may not be visible to you. Text markers are not used to identify which functions are available to each user role level.

### 6.1 Categories and Pages

This section summarizes all of the categories and primary pages (those linked from the left navigation bar) within the Uyuni Web interface (Web UI). It does not list the many subpages, tabs and subtabs accessible from the individual pages. Each area of the Web interface is explained in detail later in this guide.

*Main Menu* > *Home*. Check your tasks and systems. View and manage your primary account information and get help.

*Overview*. Obtain a quick overview of your account. This page notifies you if your systems need attention, provides a quick link directly to these systems, displays the most recent patch alerts for your account, and recently registered systems.

*Your Account*. Update your personal profile, addresses, email, and credentials. Deactivate your account.

*Your Preferences*. Indicate if you wish to receive email notifications about available patches for your systems. Set how many items are displayed in system and group lists. Set contents of the overview start page. Select your preferred CSV separator.

Locale Preferences. Configure timezone.

Your Organization. Update organization configuration and display organization trusts.

Main Menu > Systems. Manage all your systems (including virtual guests) here.

*Overview.* View a summary of your systems or system groups showing how many available patches each system has and which systems are entitled.

*Systems*. Select and view subsets of your systems by specific criteria, such as Virtual Systems, Unprovisioned Systems, Recently Registered, Proxy, and Inactive.

*System Groups*. List your system groups. Create additional groups.

*System Set Manager*. Perform various actions on sets of systems, including scheduling patch updates, package management, listing and creating new groups, managing channel entitlements, deploying configuration files, schedule audits, apply system states, and check status. The availability of these actions depend on the system type.

•

*Bootstrapping*. Bootstrap minion machines using SSH. Input SSH credentials and the activation key the selected system will use for its software sources. SUSE Manager will install

required software (salt-minion packages on the client machine) and remotely perform the registration.

Visualization. Graphically visualize the client topology.

•

*Advanced Search*. Quickly search all your systems by specific criteria, such as name, hard-ware, devices, system info, networking, packages, and location.

•

*Activation Keys.* Generate an activation key for a Uyuni-entitled system. This activation key can be used to grant a specific level of entitlement or group membership to a newly registered system using the rhnreg\_ks command.

٠

Stored Profiles. View system profiles used to provision systems.

•

*Custom System Info*. Create and edit system information keys with completely customizable values assigned while provisioning systems.

•

*Autoinstallation*. Display and modify various aspects of autoinstallation profiles (Kickstart and AutoYaST) used in provisioning systems.

Software Crashes. List software crashes grouped by UUID.

•

*Virtual Host Managers*. Display and modify virtual host managers, file-based or VMware-based.

Salt. View all minions. Manage on-boarding, remote commands, and states catalogs.

Keys. Manage minion keys.

•

*Remote Commands*. Execute remote commands on targeted systems. Select the preview button to ensure selected targets are available and click Run to execute.

•

State Catalog. Create, store, and manage states for your Salt minions from the State Catalog.

Main Menu > Images. Image building and inspection.

Images. View all built images.

Build. Execute image build.

**Profiles.** View and create image building profiles.

Stores. View and create image stores.

Main Menu > Patches. View and manage patch (errata) alerts here.

Patches. Lists patch alerts and downloads associated RPMs relevant to your systems.

*Advanced Search*. Search patch alerts based on specific criteria, such as synopsis, advisory type, and package name.

Manage Patches. Manage the patches for an organization's channels.

*Clone Patches*. Clone patches for an organization for ease of replication and distribution across an organization.

Software. View and manage the available Uyuni channels and the files they contain.

*Main Menu* > *Channels*. View a list of all software channels and those applicable to your systems.

*Package Search*. Search packages using all or some portion of the package name, description, or summary, with support for limiting searches to supported platforms.

Manage Software Channels. Create and edit channels used to deploy configuration files.

•

*Distribution Channel Mapping*. Define default base channels for servers according to their operating system or architecture when registering.

Main Menu > Audit. View and search CVE audits, system subscriptions, and OpenSCAP scans.

•

*CVE Audit*. View a list of systems with their patch status regarding a given CVE (Common Vulnerabilities and Exposures) number.

Subscription Matching. List subscriptions.

OpenSCAP. View and search OpenSCAP (Security Content Automation Protocol) scans.

*Main Menu* > *Configuration*. Keep track of and manage configuration channels, actions, individual configuration files, and systems with Uyuni-managed configuration files.

*Overview*. A general dashboard view that shows a configuration summary.

*Configuration Channels*. List and create configuration channels from which any subscribed system can receive configuration files.

- *Configuration Files.* List and create files from which systems receive configuration input.
- *Systems*. List the systems that have Uyuni-managed configuration files.

Main Menu > Schedule. Keep track of your scheduled actions.

*Pending Actions*. List scheduled actions that have not been completed.

*Failed Actions*. List scheduled actions that have failed.

*Completed Actions*. List scheduled actions that have been completed. Completed actions can be archived at any time.

Archived Actions. List completed actions that have been selected to archive.

Action Chains. View and edit defined action chains.

*Main Menu > Users*. View and manage users in your organization.

User List. List users in your organization.

•

System Group Configuration. Configure user group creation.

*Main Menu* > *Admin*. Use the Setup Wizard to configure Uyuni. List, create, and manage one or more Uyuni organizations. The Uyuni administrator can assign channel entitlements, create and assign administrators for each organization, and other tasks.

Setup Wizard. Streamlined configuration of basic tasks.

Organizations. List and create new organizations.

*Users*. List all users known by Uyuni, across all organizations. Click individual user names to change administrative privileges of the user.

### Note

Users created for organization administration can only be configured by the organization administrator, *not* the Uyuni administrator.

*Manager Configuration*. Make General configuration changes to the Uyuni server, including Proxy settings, Certificate configuration, Bootstrap Script configuration, Organization changes, and Restart the Uyuni server.

ISS Configuration. Configure master and slave servers for inter-server synchronization.

Task Schedules. View and create schedules.

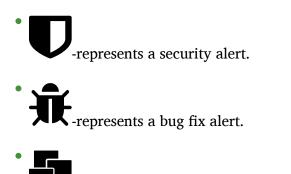

- Task Engine Status. View the status of the various tasks of the Uyuni task engine.
- *Show Tomcat Logs*. Display the log entries of the Tomcat server, on which the Uyuni server is running.

*Main Menu* > *Help*. List references to available help resources such as the product documentation, release notes, and a general search for all of this.

*Main Menu* > *External Links*. List external links to the knowledge base and the online documentation.

# 6.2 Patch Alert Icons

Throughout Uyuni you will see three patch (errata) alert icons.

-represents an enhancement alert.

On the *Main Menu* > *Home* > *Overview* page, in the <u>Relevant Security Patches</u> section click the patch advisory to view details about the patch or click the number of affected systems to see which systems are affected by the patch alert. Both links take you to tabs of the <u>Patch</u> <u>Details</u> page. If all patches are installed, there is just a <u>View All Patches</u> link to open the *Main Menu* > *Patches* page. Refer to *Section 11.2.2, "Patch Details"* for more information.

### 6.3 Search

In the top bar, Uyuni offers a search functionality for Packages, Patches (Errata), Documentation, and Systems. To use the search, click the magnifier, then select the search item (choose from <u>Systems</u>, <u>Packages</u>, <u>Documentation</u>, and <u>Patches</u>) and type a string to look for a name match. Click the *Search* button. Your results appear at the bottom of the page.

If you misspell a word during your search query, the Uyuni search engine performs approximate string (or fuzzy string) matching, returning results that may be similar in spelling to your misspelled queries.

For example, if you want to search for a certain development system called <u>test-1.exam-</u> ple.com that is registered with Uyuni, but you misspell your query <u>tset</u>, the <u>test-1.exam-</u> ple.com system still appears in the search results.

### Note

If you add a distribution or register a system with a Uyuni server, it may take several minutes for it to be indexed and appear in search results.

- For advanced System searches, refer to Section 7.8, "Systems > Advanced Search".
- For advanced Patch or Errata searches, refer to Section 11.3, "Advanced Search".
- For advanced Package searches, refer to Section 12.2, "Package Search".
- For advanced Documentation searches, refer to Section 19.7, "Search".

### 6.4 Systems Selected

On the *Main Menu* > *Systems* > *Overview* page, if you mark the check box next to a system, the <u>system selected</u> number on the right area of the top bar increases. This number keeps track of the systems you have selected for use in the System Set Manager (SSM); for more information, see to *Section 7.5, "Systems* > *System Set Manager"*.

At any time, it identifies the number of selected systems and provides the means to work (simultaneously) with an entire selection. Clicking the the rubber symbol (<u>Clear</u>) deselects all systems, while clicking the <u>system selected</u> string (<u>Manage</u>) launches the System Set Manager with your selected systems in place.

These systems can be selected in a number of ways. Only systems with at least a Management system role are eligible for selection. On all system and system group lists, a check boxes exist for this purpose. Each time you select a check box next to the systems or groups the <u>systems</u> <u>selected</u> counter at the top of the page changes to reflect the new number of systems ready for use in the System Set Manager.

### 6.5 Lists

The information within most categories is presented in the form of lists. These lists have some common features for navigation. For instance, you can set the number of <u>items per page</u> and navigate through virtually all lists by clicking the back and next arrows above and below the right side of the table. Some lists also offer the option to retrieve items alphabetically by clicking numbers or letters from the Alphabetical Index above the table.

# Note: Performing Large List Operations

Performing operations on large lists (such as removing RPM packages from the database with the Uyuni Web UI) may take some time and the system may become unresponsive or signal "Internal Server Error 500". Nevertheless, the command will succeed in the background if you wait long enough.

Login to the Uyuni Web UI to view the Main Menu > Home > Overview page. The Overview page contains summary panes that provide important information about your systems.

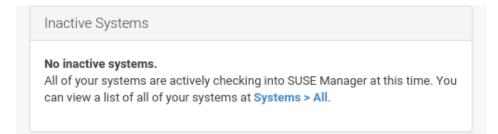

[guimenu]``Overview is split into functional sections, with the most critical sections displayed first. Users can control which of the following sections are displayed by making selections on the Main Menu > Home > Your Preferences page. Refer to Section 6.8, "Your Preferences" for more information.

• The <u>Tasks</u> pane lists the most common tasks an administrator performs via the Web interface. Click any link to reach the page within Uyuni that allows you to accomplish that task.

| Tasks  |  |
|--|--|
| <ul> <li>Manage System Types:<br/>My Organization</li> </ul> |  |
| Register Systems   |  |
| Manage Activation Keys                                       |  |
| Manage Autoinstallations                                     |  |
| Manage Configuration Files                                   |  |
| Manage Organizations   |  |
| Configure SUSE Manager                                       |  |
|  |  |

• The <u>Inactive Systems</u> list provides a list of all systems that have stopped checking into Uyuni.

• The <u>Most Critical Systems</u> panelists the most critical systems within your organization. It provides a link to quickly view those systems and displays a summary of the patch updates that have yet to be applied to those systems. Click the name of a system to see its <u>System Details</u> page and apply the patch updates. Below the list is a link to <u>View</u> All Critical Systems on one page.

| Most Critica                        | l Systems                                     |                  |                |                           |
|-------------------------------------|---|------------------|----------------|---------------------------|
| System                              | All Updates                                   | Security Patches | Bugfix Patches | Enhancement Patches       |

| 0       | doc-minion-1.tf.local | (none)       | 6/5/18 11:44:10 AM CEST | Unknown       | Salt        |

To return to this page, select Main Menu > Home > Overview that is also known as The Menu.

# 6.6 Notification Messages

The *Main Menu > Home > Notification Messages* page allows you to manage your notification messages of the Uyuni server.

| Mark all as read    |
|---------------------|
| 25 🔻 items per page |
|                     |
|                     |
|                     |

### 6.6.1 Notification Messages Tabs

The Notification Messages page displays two tabs:

- Unread Messages
- All Messages

These tabs contain a list of collected messages filtered by tab name.

### 6.6.2 Notification Messages Buttons

The following buttons are available for working with notification messages:

- Refresh Refreshes the message list
- *Delete Selected Messages* Check any messages you would like removed and then mass delete them via this button.
- Mark all as Read Mark all messages as read.

### 6.6.3 Notification Messages Legend

Several columns provide information for each message:

• <u>Severity</u> : The following severity levels are available and for every failure a customized button (in line with the message) is available to react to that failure:

- Type : Available types are:
  - Onboarding failed(*Error*)
  - Channel sync finished (Info)
  - Channel sync failed (Error)
- Description : The text of the message with a link to the channel.

- Created : The date when the message was created.
- Action Read|Delete :
  - Click the letter icon to flag a message as *Read* or *Unread*.
  - Click the waste bin icon delete a message immediately.

You can sort the messages by clicking a column label of the list header line.

### 6.7 User Account

### 6.7.1 Your Account

Modify your personal information, such as name, password, and title from the *Main Menu* > *Home* > *User Account* > *Your Account* page. To modify this information, make the changes in the appropriate text fields and click the *Update* button at the bottom.

| ersonal Info                            |   |
|---|---|
| ease enter your information in the form | provided below. Entries marked with an asterisk (*) are $\ensuremath{required}$ |
| Username:                               | admin   |
| Prefix:                                 |   |
| First Name *:                           | Administrator   |
| Last Name *:                            | Administrator   |
| Position:                               |   |
| Password *:                             | ····· <b>②</b>  |
| Confirm Password *:                     | ····· 🕑   |
| Password Strength:                      |   |
| Email:                                  | 2 galaxy-noise@suse.de  |
| Created:                                | Today at 11:42 AM   |
| Last Sign In:                           | 3 minutes ago   |
|   | Update  |

If you change your Uyuni password, for security reasons you will not see the new password while you enter it. Replace the asterisks in the <u>Password</u> and <u>Confirm Password</u> text fields with the new password.

### Note

If you forget your password or username, proceed to the sign in screen and select the <u>About</u> link, then select the <u>Lookup Login/Password</u> page. Here you can either specify your login and email address or only your email address if you are not sure about the username. Then click *Send Password* or *Send Login* respectively.

### 6.7.2 Addresses

On the *Main Menu > Home > User Account > Addresses* page you can manage your mailing, billing and shipping addresses, and associated phone numbers.

| 🛔 Addresses 🍳   |    |
|---|----|
| Addresses associated with your SUSE Manager account are listed below. |    |
| Mailing Address   |    |
| Address not filled in   | () |
| Fill in this address  |    |

Click *Fill in this address* or *Edit this address* below the address to be modified or added, make your changes, and click *Update*.

| Mailing Address Record:                   |  |
|---|--|
| Please enter your information in the form | provided below. Entries marked with an asterisk (*) are $required$ . |
| Phone*:                                   |  |
| FAX:                                      |  |
| Address*:                                 |  |
|   |  |
| City*:                                    |  |
| State/Province*:                          |  |
|   | (required for US or Canada)  |
| Zipcode*:                                 |  |
| Country*:                                 | Afghanistan  |
|   | Update   |

### 6.7.3 Change Email

Set the email Uyuni sends notifications to on the *Main Menu* > *Home* > *User Account* > *Change Email* page. If you would like to receive email notifications about patch alerts or daily summaries for your systems, check the *Receive email notifications* checkbox located on the Your Preferences page.

| 📥 Change Email Address <sup>@</sup>   |                      |  |  |  |  |
|---------------------------------------|----------------------|--|--|--|--|
| Please enter your new email address b | elow.                |  |  |  |  |
| Email Address:                        | galaxy-noise@suse.de |  |  |  |  |
|                                       | Update               |  |  |  |  |
|                                       |                      |  |  |  |  |

To change your preferred email address, click *Main Menu* > *Home* > *User Account* > *Change Email*. Enter your new email address and click the *Update* button. Invalid email addresses like those ending in <u>@localhost</u> are filtered and rejected.

### 6.7.4 Account Deactivation

The *Main Menu* > *Home* > *User Account* > *Account Deactivation* page provides a means to cancel your Uyuni service. To do so, click the *Deactivate Account* button. The Web interface returns you to the login screen. If you attempt to log back in, an error message advises you to contact the Uyuni administrator for your organization.

| Account D                                    | eactivation <sup>®</sup>     |                            |                            |          |  |
|--|------------------------------|----------------------------|----------------------------|----------|--|
| You may deactivate you<br>Deactivate Account | ır SUSE Manager account bele | w. This will remove your a | ability to log into SUSE N | fanager. |  |
|  | •                            |                            |                            |          |  |

### Note: Uyuni Administrator Account

If you are the only Uyuni Administrator for your organization, you cannot deactivate your account.

# 6.8 Your Preferences

The Main Menu > Home > YourPreferences page allows you to configure Uyuni options.

| 🗱 Your Preferences 🕫   |
|--|
| Email Notifications  |
| SUSE Manager offers email notifications for when patches relevant to your systems are released, as well as daily emails summarizing the events for your systems.<br>Receive email notifications<br>Receive taskomatic notifications  |
| SUSE Manager List Page Size  |
| This controls how many entries, like systems, would be displayed per page in a list context.<br>Show 25 🖌 entries per list page  |
| "Overview" Start Page  |
| <ul> <li>Tasks: A task-oriented menu of quick links to different areas of the SUSE Manager user interface.</li> <li>Most Critical Systems: A listing of the systems with the most critical update and health status.</li> <li>System Groups: Preview the overall status of your system groups.</li> <li>Relevant Security Errata: View the most recent security errata applicable to your systems.</li> <li>Inactive Systems: Lists the registered SUSE Manager systems that recently stopped checking in.</li> <li>Recently Scheduled Actions: Lists the scheduled actions of the user.</li> <li>Recently Registered Systems: A listing of the most recently registered systems within the past 30 days.</li> </ul> |
| Time Zone  |
| Dates and times, like system checkin times, will be shown according to the selected timezone.       Display all times as     (GMT+0100) Europe (Central)   |
| CSV Files  |
| Configure a separator character to be used in downloadable CSV files:<br>© Comma (",", default)<br>© Semicolon (",", compatible with Microsoft® Excel®)  |
| Save Preferences   |

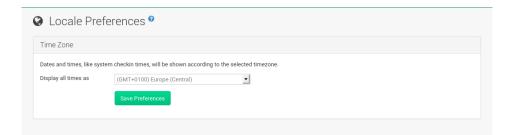

• <u>Email Notifications</u> — Determine whether you want to receive email every time a patch alert is applicable to one or more systems in your account.

## Important

This setting enables Management and Provisioning customers to receive a daily summary of system events. These include actions affecting packages, such as scheduled patches, system reboots, or failures to check in. In addition to selecting this check box, you must identify each system to be included in this summary email. By default, all Management and Provisioning systems are included in the summary. Add more systems either individually on the System Details page or for multiple systems at once in the *Main Menu* > *Systems* > *System Set Manager* interface. Note that Uyuni sends these summaries only to verified email addresses. To disable all messages, simply deselect this check box.

- <u>SUSE Manager List Page Size</u> Maximum number of items that appear in a list on a single page. If more items are in the list, clicking the *Next* button displays the next group of items. This preference applies to system lists, patch lists, package lists, and so on.
- <u>"Overview"</u> Start Page Select the information panes that are displayed on the *Main Menu* > *Home* > *Overview* page. Check the box to the left of each information pane that which be included.
- <u>Time Zone</u> Set the Uyuni interface to your local time by selecting the appropriate <u>Time</u> Zone from the drop-down box. Click the *Save Preferences* button to apply the selection.

• <u>CSV Files</u> — Select the separator character to be used in downloadable CSV files. *Comma* is the default; as an alternative use *Semicolon*, which provides better compatibility with Microsoft Excel.

After making changes to any of these options, click the Save Preferences button.

# 6.9 Your Organization

From the Main Menu > Home > Your Organization page you can modify the following pages:

- Configuration
- Organization Trusts
- Configuration Channels

## 6.9.1 Configuration

On the *Main Menu* > *Home* > *Your Organization* > *Configuration* page modify your personal information, such as name, password, and title. To modify any of this information, make the changes in the appropriate text fields and click the *Update* button at the bottom.

| ganization Configuration   |   |
|--|---|
| elow is your organization configuration                                      | listed. See, how staging content, errata e-mail notifications, software crash reporting and SCAP settings are configured. |
| Enable Staging Contents  | c   |

| Allow Deletion After (period in days):                                       | 90  |
|  | Update Organization   |

## 6.9.2 Organization Trusts

The *Main Menu* > *Home* > *Your Organization* > *Organization Trusts* page displays the trusts established with your organization (that is, the organization with which you, the logged-in user, are associated). The page also lists <u>Channels Shared</u>, which refers to channels available to your organization via others in the established trusts.

| 嶜 Organizations 🍳                 |                 |  |
|-----------------------------------|-----------------|--|
| Organizations Trusted By SUSE (1) |                 |  |
| Organization                      | Channels Shared |  |
|                                   |                 |  |
| No Organizations.                 |                 |  |

You can filter the list of trusts by keyword using the Filter by Organization text box and clicking *Go*.

## 6.9.3 Configuration Channels

The <u>Configuration Channels</u> page displays the channels which have been created and added using Configuration Channels.

From *Main Menu* > *Home* > *Your Organization* > *Configuration Channels* you can select which configuration channels should be applied across your organization. If there is more than one configuration channel selected you can specify the order of the channels.

| Configuration Channels |                                  |        |        |        |              |
|------------------------|----------------------------------|--------|--------|--------|--------------|
|                        |                                  |        |        |        | Apply Reorde |
|                        | Search in configuration channels |        | Search | System | No Changes   |
| Channel Name           |                                  | Assign | 1      |        |              |
| aoeu                   |                                  |        |        |        |              |
|                        |                                  | •      |        |        |              |

PROCEDURE: APPLY A CONFIGURATION CHANNEL AT THE ORGANIZATION LEVEL

- 1. Create a channel using Configuration Channels or via the command line.
- 2. Browse to Main Menu > Home > Your Organization > Configuration Channels.
- 3. Use the search feature to locate a channel by name.
- 4. Select the check box for the channel to be applied and click the *Save Changes* button. The save button will save the change to the database but will not apply the channel.
- 5. Apply the channel by clicking the *Apply* button. The channel will be scheduled and applied to any systems included within the organization.

# 7 Systems

If you select *Main Menu* > *Systems* > *Overview*, an overview of all Systems appears. From this page you can select systems to perform actions on and may create system profiles.

# 7.1 Overview Conventions

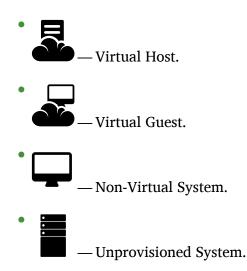

The *Main Menu* > *Systems* > *Overview* page displays a list of all your registered systems. Several columns provide information about each system:

#### Select box

Systems without a system type cannot be selected. To select systems, mark the appropriate check boxes. Selected systems are added to the **System Set Manager**, where actions can be carried out simultaneously on all systems in the set. For more information, see *Section 7.5, "Systems > System Set Manager"*.

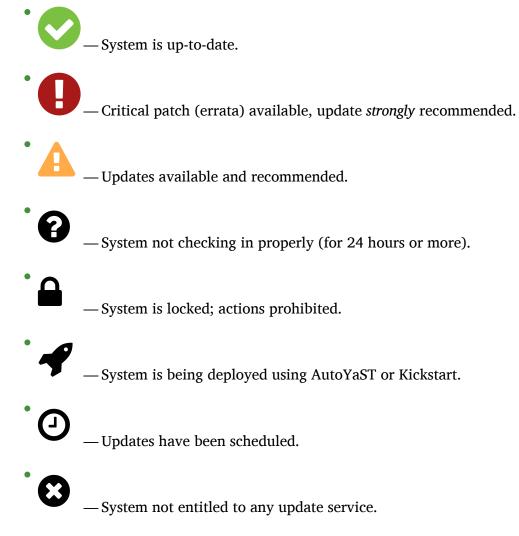

#### System

The name of the system specified during registration. The default name is the host name of the system. Clicking the name of a system displays its <u>System Details</u> page. For more information, see *Section 7.3, "System Details"*.

#### Updates

Shows which type of update action is applicable to the system or confirms that the system is up-to-date. Some icons are linked to related tasks. For example, the standard Updates icon is linked to the <u>Upgrade</u> subtab of the packages list, while the Critical Updates icon links directly to the Software Patches page.

#### Patches

Total number of patch alerts applicable to the system.

#### Packages

Total number of package updates for the system, including packages related to patch alerts and newer versions of packages not related to patch alerts. For example, if a client system that has an earlier version of a package installed gets subscribed to the appropriate base channel (such as SUSE Linux Enterprise 12 SP2), that channel may have an updated version of the package. If so, the package appears in the list of available package updates.

0

# Important: Package Conflict

If Uyuni identifies package updates for the system, but the package updater (such as Red Hat Update Agent or YaST) responds with a message such as "Your system is fully updated", a conflict likely exists in the system's package profile or in the <u>up2date</u> configuration file. To resolve the conflict, either schedule a package list update or remove the packages from the package exceptions list. For more information, see *Section 7.3, "System Details"*.

#### Configs

Total number of configuration files applicable to the system.

#### Base Channel

The primary channel for the system based on its operating system. For more information, see *Section 12.1, "Channels"*.

#### System Type

Shows whether the system is managed and at what service level.

Links in the navigation bar below *Main Menu* > *Systems* enable you to select and view predefined sets of your systems. All of the options described above can be applied within these pages.

# 7.2 Systems > Overview

The *Main Menu* > *Systems* > *Overview* page provides a summary of your systems, including their status, number of associated patches (errata) and packages, and their so-called system type. Clicking the name of a system takes you to its <u>System Details</u> page. For more information, see *Section 7.3, "System Details"*.

Clicking the *View System Groups* button at the top of the page takes you to a summary of your system groups. It identifies group status and displays the number of systems contained. Clicking the number of systems in a group takes you to the *Main Menu* > *Systems* > *Systems Groups* > *Systems* tab. Selecting a group name takes you to the *Main Menu* > *Systems* > *System Groups* > *Group Details* tab for that system group. For more information, see *Section 7.4.3, "System Group Details"*.

You can also click *Use in SSM* from the *Systems* > *Overview* > *View System Groups* page to go directly to the *Systems* > *System Set Manager*. For more information, see *Section 7.5, "Systems* > *System Set Manager"*.

## 7.2.1 Systems > Systems

Pages with various lists of system groupings.

## 7.2.2 Systems > All

The *Systems* > *Systems* > *All* page contains the default set of your systems. It displays every system you have permission to manage. You have permission if you are the only user in your organization, if you are a Uyuni Administrator, or if the system belongs to a group for which you have admin rights.

| Select All 1 - 6 of 6     |          |                     |                |         |              |                     |

|  |         |         |                       |                   |

#### System

This column displays the name of each guest system.

#### Updates

This column shows whether there are patches (errata updates) available for the guest systems that have not yet been applied.

#### Status

This column indicates whether a guest is running, paused, or stopped.

#### Base Channel

This column displays the base channel to which the guest is currently subscribed.

Only guests registered with Uyuni are displayed with blue text. Clicking the host name of such a guest system displays its System Details page.

## 7.2.5 Systems > Unprovisioned Systems

Here, all unprovisioned (bare-metal) systems with hardware details are listed. For more information, see *Section 18.4.6*, *"Manager Configuration > Bare-metal systems"*.

| Unp         | provisioned | Systems <sup>©</sup> |                 |     |                 |                 |
|-------------|-------------|----------------------|-----------------|-----|-----------------|-----------------|
| System      | Detected on | Number of CPUs       | Clock frequency | RAM | Number of disks | MAC Address(es) |
| No systems. |             |                      |                 |     |                 |                 |

# 7.2.6 Systems > Out of Date

The *Systems* > *Systems* > *Out of Date* page displays all systems where applicable patch alerts have not been applied.

| System      | Updates | Patches | Packages | Configs | Base Channel | System Type |
|-------------|---------|---------|----------|---------|--------------|-------------|
| lo systems. |         |         |          |         |              |             |

# 7.2.7 Systems > Requiring Reboot

The *Systems* > *Systems* > *Requiring Reboot* page displays all systems that need to be rebooted. Click a system name to go to the systems details page to schedule a reboot.

| Patches | Packages | Configs          | Base Channel            | System Type                          |
|---------|----------|------------------|-------------------------|--------------------------------------|
|         | Fatches  | ratches rackages | ratches rackages comigs | ratches rackages conngs base channel |

# 7.2.8 Systems > Non-compliant Systems

Non-compliant systems have packages installed which are not available from Uyuni. The <u>Pack-ages</u> column shows how many installed packages are not available in the channels assigned to the system. A non-compliant system cannot be reinstalled.

| Select All 1 - 4 of 4  |                        |          |              |                     |

## 7.2.11 Systems > Inactive

The *Systems* > *Systems* > *Inactive Systems* page displays systems that have not checked in with Uyuni for 24 hours or more.

| System U | odates Patche | Packages | Configs | Last Checked in | Base Channel | System Type |
|----------|---------------|----------|---------|-----------------|--------------|-------------|
|----------|---------------|----------|---------|-----------------|--------------|-------------|

Checking in means that Zypper on SUSE Linux Enterprise or Red Hat Update Agent on Red Hat Enterprise Linux client systems connects to Uyuni to see if there are any updates available or if any actions have been scheduled. If you see a message telling you that check-ins are not taking place, the client system is not successfully connecting to Uyuni.

The reason may be one of the following:

- The system is not entitled to any Uyuni service. System profiles that remain unentitled for 180 days (6 months) are removed.
- The system is entitled, but the Uyuni daemon (<u>rhnsd</u>) has been disabled on the system. Refer to *Book "Best Practices", Chapter 8 "Contact Methods", Section 8.2 "Default (the Uyuni Daemon rhnsd)"* for instructions on restarting and troubleshooting.
- The system is behind a firewall that does not allow connections over https (port 443).

- The system is behind an HTTP proxy server that has not been properly configured.
- The system is connected to a Uyuni Proxy Server or Uyuni that has not been properly configured.
- The system itself has not been properly configured, perhaps pointing at the wrong Uyuni Server.
- The system is not in the network.
- Some other barrier exists between the system and the Uyuni Server.

## 7.2.12 Systems > Recently Registered

The *Systems* > *Systems* > *Recently Registered* page displays any systems that have been registered in a given period. Use the drop-down box to specify the period in days, weeks, 30- and 180-day increments, and years.

| Select All       | ntly Registered Syste  |                          |                   |               |                    |

## 7.2.14 Systems > Duplicate Systems

The *Systems* > *Systems* > *Duplicate Systems* page lists current systems and any active and inactive entitlements associated with them.

| 🖵 Duplicate   | Systems 🕫                                 |                    |                       |                     |
|---|---|--------------------|-----------------------|---------------------|
| Inactive systems are listed<br>A system is inactive if its sy | below.<br>ystem has not checked in for: 1 | Day 💌              |                       |                     |
| Duplicate IP Address  | Duplicate IPv6 Address                    | Duplicate Hostname | Duplicate MAC Address |                     |
|   |   |                    |                       |                     |
|   |   |                    |                       | Delete Selected     |
|   |   |                    |                       | Show All   Hide All |
| System  |   | Last Checked in    |                       |                     |
| No systems.   |   |                    |                       |                     |
| Select Inactive   |   |                    |                       |                     |

Active entitlements are in gray, while inactive entitlements are highlighted in yellow and their check boxes checked by default for you to delete them as needed by clicking the *Delete Selected* button. Entitlements are inactive if the system has not checked in with Uyuni in a time specified via the drop-down box *A system profile is inactive if its system has not checked in for:*. You can filter duplicate entitlements by clicking the respective tab:

- Duplicate Systems > IP Address
- Duplicate Systems > IPv6 Address
- Duplicate Systems > Hostname
- Duplicate Systems > MAC address

You may filter further by inactive time or typing the system's host name, IP address, IPv6 address, or MAC address in the corresponding Filter by text box.

To compare up to three duplicate entitlements at one time, click the <u>Compare Systems</u> link in the Last Checked In column. Inactive components of the systems are highlighted in yellow.

You can determine which systems are inactive or duplicate and delete them by clicking the *Delete System Profile* button.

Click the *Confirm Deletion* button to confirm your choice.

## 7.2.15 Systems > System Currency

The System Currency Report displays an overview of severity scores of patches relevant to the system. The weighting is defined any systems, <u>System Details</u> page. The default weight awards critical security patches with the heaviest weight and enhancements with the lowest. The report can be used to prioritize maintenance actions on the systems registered to Uyuni.

A list of profiled systems follows, with their base and add-on system types shown in the appropriate columns. To change system types, select the systems you want to modify, and click either the *Add System Type* or *Remove System Type* button.

# 7.3 System Details

When systems are registered to Uyuni, they are displayed on the *Main Menu > Systems > Overview* page. Here and on any other page, clicking the name of a system takes you to the <u>System</u> Details page of the client, where various types of administrative tasks can be performed.

# Note

The *Delete System* link in the upper right of this screen refers to the system profile only. Deleting a host system profile will not destroy or remove the registration of guest systems. Deleting a guest system profile does not remove it from the list of guests for its host, nor does it stop or pause the guest. It does, however, remove your ability to manage it via Uyuni.

If you mistakenly deleted a system profile from Uyuni, you may re-register the system using the bootstrap script or rhnreg\_ks manually.

The Details page has numerous subtabs that provide specific system information and other identifiers unique to the system. The following sections discuss these tabs and their subtabs in detail.

## 7.3.1 System Details > Details

This page is not accessible from the left bar. However, clicking the name of a system anywhere in the Web interface displays such a System Details page. By default, the *Systems Details > Details > Overview* subtab is displayed. Other tabs are available, depending on the system type and add-on system type.

For example, Traditional systems and Salt systems details display different tabs.

| Details Software        | Configuration Provisioni   | ng Groups   | Audit Eve    | ents          |             |                          |               |

FIGURE 7.2: SYSTEM DETAILS (SALT)

### 7.3.1.1 System Details > Details > Overview

This system summary page displays the system status message and the following key information about the system:

#### System Status

This message indicates the current state of your system in relation to Uyuni.

## 🔊 Note

If updates are available for any entitled system, the message <u>Software</u> Updates <u>Available</u> appears, displaying the number of critical and non-critical updates and the sum of affected packages. To apply these updates, click *System Details* > *Packages* then select some or all packages to update, then click *Upgrade Packages*.

#### System Info

#### Hostname

The host name as defined by the client system. A machine can have one and only one hostname.

#### FQDN

The FQDN(Names) listed here represents the host.domain that the machine answers to. A machine can have any number of FQDNs. Keep in mind that FQDN is not equal to hostname.

#### **IP Address**

The IP address of the client.

#### **IPv6 Address**

The IPv6 address of the client.

#### Virtualization

If the client is a virtual machine, the type of virtualization is listed.

#### UUID

Displays the universally unique identifier.

#### Kernel

The kernel installed and operating on the client system.

#### Uyuni System ID

A unique identifier generated each time a system registers with Uyuni.

### Note

The system ID can be used to eliminate duplicate profiles from Uyuni. Compare the system ID listed on this page with the information stored on the client system in the <u>/etc/sysconfig/rhn/systemid</u> file. In that file, the system's current ID is listed under <u>system\_id</u>. The value starts after the characters <u>ID-</u>. If the value stored in the file does not match the value listed in the profile, the profile is not the most recent one and may be removed.

#### **Activation Key**

Displays the activation key used to register the system.

#### **Installed Products**

Lists the products installed on the system.

#### Lock Status

Indicates whether a system has been locked.

Actions cannot be scheduled for locked systems on the Web interface until the lock is removed manually. This does not include preventing automated patch updates scheduled via the Web interface. To prevent the application of automated patch updates, deselect *System Details > Properties > Auto Patch Update*. For more information, refer to *Section 7.3.1.2, "System Details > Details > Properties"*.

Locking a system can prevent you from accidentally changing a system. For example, the system may be a production system that should not receive updates or new packages until you decide to unlock it.

### Important

Locking a system in the Web interface *will not* prevent any actions that originate from the client system. For example, if a user logs in to the client directly and runs YaST Online Update (on SUSE Linux Enterprise) or <u>pup</u> (on RHEL), the update tool will install available patches even if the system is locked in the Web interface. Locking a system *does not* restrict the number of users who can access the system via the Web interface. If you want to restrict access to the system, associate that system with a System Group and assign a System Group Administrator to it. Refer to *Section 7.4, "Systems > System Groups"* for more information about System Groups.

It is also possible to lock multiple systems via the System Set Manager. Refer to *Section 7.5.10.4, "System Set Manager > Misc > Lock/Unlock"* for instructions.

#### **Subscribed Channels**

List of subscribed channels. Clicking a channel name takes you to the <u>Basic Channel</u> <u>Details</u> page. To change subscriptions, click the <u>Alter Channel Subscriptions</u> link right beside the title to assign available base and child channels to this system. When finished making selections, click the *Change Subscriptions* button to change subscriptions and the base software channel. For more information, see *Section 7.3.2.3, "System Details > Software > Software Channels"*.

#### **Base Channel**

The first line indicates the base channel to which this system is subscribed. The base channel should match the operating system of the client.

#### **Child Channels**

The subsequent lines of text, which depend on the base channel, list child channels. An example is the SUSE Manager Tools channel.

#### System Events

#### Checked In

The date and time at which the system last checked in with Uyuni.

#### Registered

The date and time at which the system registered with Uyuni and created this profile.

#### Last Booted

The date and time at which the system was last started or restarted.

### Note

Systems with Salt or Management system type can be rebooted from this screen.

- 1. Select Schedule system reboot.
- 2. Provide the earliest date and time at which the reboot may take place.
- 3. Click the *Schedule Reboot* button in the lower right.

When the client checks in after the scheduled start time, Uyuni will instruct the system to restart itself.

#### System Properties

#### System Types

Lists system types and add-on types currently applied to the system.

#### Notifications

Indicates the notification options for this system. You can activate whether you want to receive e-mail notifying you of available updates for this system. In addition, you may activate to include systems in the daily summary e-mail.

#### **Contact Method**

Available methods: Default (Pull), Push via SSH, and Push via SSH tunnel.

The so-called OSA status is also displayed for client systems registered with Uyuni that have the OSA dispatcher (osad) configured.

Push enables Uyuni customers to immediately initiate tasks rather than wait for those systems to check in with Uyuni. Scheduling actions through push is identical to the process of scheduling any other action, except that the task can immediately be carried out instead of waiting the set interval for the system to check in.

In addition to the configuration of Uyuni, to receive pushed actions each client system must have the osad package installed and its service started.

#### Auto Patch Update

Indicates whether this system is configured to accept updates automatically.

#### System Name

By default, the host name of the client is displayed, but a different system name can be assigned.

#### Description

This information is automatically generated at registration. You can edit the description to include any information you want.

#### Location

This field displays the physical address of the system if specified.

Clicking the <u>Edit These Properties</u> link beside the <u>System Properties</u> title opens the *System Details > Details > Properties* subtab. From this page you can edit any text fields you choose, then click the *Update Properties* button to confirm.

### 7.3.1.2 System Details > Details > Properties

This subtab allows you to alter basic properties of the selected system.

|                    | Rack:                                   |                         |                          |                  |         |       |             |

#### System Details

System Name

By default, this is the host name of the system. You can however alter the profile name to anything that allows you to distinguish this system from others.

#### **Base System Type**

For information only.

#### Add-on System Types

Select one of the available system types such as Container Build Host.

#### Notifications

Select whether notifications about this system should be sent and whether to include this system in the daily summary. This setting keeps you aware of all advisories pertaining to the system. Anytime an update is released for the system, you receive an e-mail notification.

The daily summary reports system events that affect packages, such as scheduled patch updates, system reboots, or failures to check in. In addition to including the system here, you must activate to receive e-mail notification in Main Menu > Home > Overview > Your Preferences.

#### **Contact Method**

Select one of the following contact methods:

- Pull (Default)
- Push via SSH
- Push via SSH tunnel

#### Auto Patch Update

If this box is checked, available patches are automatically applied to the system when it checks in (Pull) or immediately if you select either Push option. This action takes place without user intervention. The Uyuni Daemon (rhnsd) must be enabled on the system for this feature to work.

# Note: Conflicts With Third Party Packages

Enabling auto-update might lead to failures because of conflicts between system updates and third party packages. To avoid failures caused by those issues, it is better to leave this box unchecked.

#### Description

By default, this text box records the operating system, release, and architecture of the system when it first registers. Edit this information to include anything you like.

The remaining fields record the physical address at which the system is stored. To confirm any changes to these fields, click the *Update Properties* button.

# Note: Setting Properties for Multiple Systems

Many of these properties can be set for multiple systems in one go via the System Set Manager interface. For details, see *Section 7.5, "Systems > System Set Manager"*.

### 7.3.1.3 System Details > Details > Remote Command

This subtab allows you to run remote commands on the selected system. Before doing so, you must first configure the system to accept such commands.

| 🚽 doc-client-1.tf.local       | 0   |                                  |                         |         | â De  | lete System 🛛 🛛 Add to SSM |

| Building:                     |   |                                  |                         |         |       |                            |
| Room:                         |   |                                  |                         |         |       |                            |
| Rack:                         |   |                                  |                         |         |       |                            |
|                               | Update Properties   |                                  |                         |         |       |                            |
|                               |   |                                  |                         |         |       |                            |

 On SUSE Linux Enterprise clients, subscribe the system to the Uyuni Tools child channel. Then use Zypper to install the <u>rhncfg</u>, <u>rhncfg-client</u>, and <u>rhncfg-actions</u> packages, if not already installed:

zypper in rhncfg rhncfg-client rhncfg-actions

On RHEL clients, subscribe the system to the Tools child channel. Then use <u>up2date</u> or <u>yum</u> to install the <u>rhncfg</u>, <u>rhncfg-client</u>, and <u>rhncfg-actions</u> packages, if not already installed:

yum install rhncfg rhncfg-client rhncfg-actions

2. Log in to the system as root and add the following file to the local Uyuni configuration directory: allowed-actions/scripts/run.

• Create the necessary directory on the target system:

```
mkdir -p /etc/sysconfig/rhn/allowed-actions/script
```

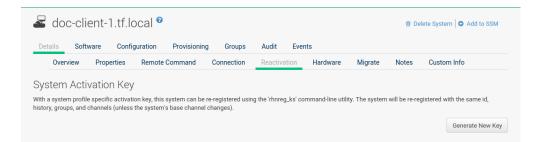

• Create an empty <u>run</u> file in that directory to act as a flag to Uyuni, signaling permission to allow remote commands:

```
touch /etc/sysconfig/rhn/allowed-actions/script/run
```

When the setup is complete, refresh the page to view the text boxes for remote commands. Identify a specific user, group, and timeout period, and the script to run. Select a date and time to execute the command, then click *Schedule* or add the remote command to an action chain. For further information on action chains, see *Section 16.5, "Action Chains"*.

### 7.3.1.4 System Details > Details > Reactivation [Management]

Reactivation keys include this system's ID, history, groups, and channels. This key can then be used only once with the <u>rhnreg\_ks</u> command line utility to re-register this system and regain all Uyuni settings. Unlike typical activation keys, which are not associated with a specific system ID, keys created here do not show up within the *Main Menu* > *Systems* > *Activation Keys* page.

Reactivation keys can be combined with activation keys to aggregate the settings of multiple keys for a single system profile. For example:

```
rhnreg_ks --server=`server-url`\
    --activationkey=`reactivation-key`,`activationkey`--force
```

# Warning

When autoinstalling a system with its existing Uyuni profile, the profile uses the system-specific activation key created here to re-register the system and return its other Uyuni settings. For this reason, you should not regenerate, delete, or use this key (with <a href="https://rhnreg\_ks">rhnreg\_ks</a>) while a profile-based autoinstallation is in progress. If you do, the autoinstallation will fail.

### 7.3.1.5 System Details > Details > Hardware

This subtab provides information about the system, such as networking, BIOS, memory, and other devices. This only works if you included the hardware profile during registration. If the hardware profile looks incomplete or outdated, click the *Schedule Hardware Refresh* button. The next time the Uyuni Daemon (<u>rhnsd</u>) connects to Uyuni, it will update your system profile with the latest hardware information.

### 7.3.1.6 System Details > Details > Migrate

This subtab provides the option to migrate systems between organizations. Select an organization form the dropdown <u>Migrate System Between Organizations</u> and click *Migrate System* to initiate the migration.

| doc-client-                       | 1.tf.loca                | al 🕫                             |                        |                            |                 |         | 🔒 De  | lete System O Add to SSM |

|                                   |                          |                                  |                        |                            |                 |         |       | Migrate System           |

## Note

Defined system details such as channel assignments, system group membership, custom data value, configuration channels, reactivation keys, and snapshots will be dropped from the system configuration after the migration.

### 7.3.1.7 System Details > Details > Notes

This subtab provides a place to create notes about the system.

#### Create Note

To add a new note, click the <u>Create Note</u> link, type a subject and write your note, then click the *Create* button.

#### **Modify Note**

To modify a note, click its subject in the list of notes, make your changes, and click the *Update* button.

#### **Remove Note**

To remove a note, click its subject in the list of notes then click the Delete Note link.

### 7.3.1.8 System Details > Details > Custom Info

This subtab provides completely customizable information about the system. Unlike <u>Notes</u>, <u>Custom Info</u> is structured, formalized, and can be searched. Before adding custom information about a system, you must create *Custom Information Keys* by selecting the <u>Custom System In-</u> <u>formation</u> link. Then, on the <u>Custom System Information</u> page, select the <u>Create Key</u> link. Provide <u>Key Label</u> and <u>Description</u> and confirm with *Create Key*. For more information, see <u>Section 7.11</u>, "Systems > Custom System Info".

| Overview        | Properties      | Remote Command             | Connection   | Reactivation | Hardware | Migrate | Notes | Custom Info   |
|-----------------|-----------------|----------------------------|--------------|--------------|----------|---------|-------|---------------|

|                 | System Inf      |                            |              |              |          |         |       | + Create Valu |
| following Custo | m System Inform | ation keys are defined for | this system. |              |          |         |       |               |
|                 |                 |                            |              |              |          |         |       |               |

Once you have created one or more keys, you may assign values for this system by selecting the <u>Create Value link</u>. Click the name of the key in the resulting list and enter a value for it in the Value field, then click the *Update Key* button.

### 7.3.1.9 System Details > Details > Proxy [Proxy]

This tab is only available for SUSE Manager Proxy systems. The tab lists all clients registered with the selected SUSE Manager Proxy server.

# 7.3.2 System Details > Software

This tab and its subtabs allow you to manage the software on the system: patches (errata), packages and package profiles, software channel memberships, and migrations.

### 7.3.2.1 System Details > Software > Patches

This subtab contains a list of patch (errata) alerts applicable to the system. Refer to *Section 6.2, "Patch Alert Icons"* for meanings of the icons on this tab.

| 占 doc-client                                     | -1.tf.local <sup>0</sup>                 |                      |              | 🖹 Delete System   🖸 Add to St |
|--|--|----------------------|--------------|-------------------------------|

| Patches Pac                                      | kages Software Channe                    | ls SP Migration Soft | ware Crashes |                               |
| Relevant Pat<br>The following patches may<br>All | CNES<br>currently be applied to this sys | stem.                |              |                               |
| Туре   | Advisory                                 | Synopsis             | Status       | Updated                       |
| .,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,          |  |                      |              |                               |

To apply updates, select them and click the *Apply Patches* button. Double-check the updates to be applied on the confirmation page, then click the *Confirm* button.

The action is added to the *Main Menu* > *Schedule* > *Pending Actions* list. Patches that have been scheduled cannot be selected for update. Instead of a check box there is a clock icon. Click the clock to see the Action Details page.

The <u>Status</u> column in the *System Details* > *Software* > *Patches* table shows whether an update has been scheduled. Possible values are:

- None
- Pending
- Picked Up
- Completed
- Failed

This column displays only the latest action related to a patch. For example, if an action fails and you reschedule it, this column shows the status of the patch as <u>Pending</u> with no mention of the previous failure. Clicking a status other than None takes you to the Action Details page.

### 7.3.2.2 System Details > Software > Packages

Manage the software packages on the system. Most of the following actions can also be performed via action chains. For further information on action chains, see *Section 16.5, "Action Chains"*.

|   | Update Package List |

# Warning

When new packages or updates are installed on the client via Uyuni, any licenses (EULAs) requiring agreement before installation are automatically accepted.

#### Packages

The default display of the Packages tab describes the options available and provides the means to update your package list. To update or complete a potentially outdated list, possibly because of the manual installation of packages, click the Update Package List button in the bottom right-hand corner of this page. The next time the Uyuni daemon (rhnsd) connects to Uyuni, it updates your system profile with the latest list of installed packages.

#### List / Remove

Lists installed packages and enables you to remove them. View and sort packages by name or the date they were installed on the system. Search for the desired packages by typing a name in the Filter by Package Name search field. You may also select the letter or number corresponding to the first character of the package name from the drop down selection menu. Click a package name to view its Package Details page. To delete packages from the system, select their check boxes and click the Remove Packages button on the bottom right-hand corner of the page. A confirmation page appears with the packages listed. Click the Confirm button to remove the packages.

#### Upgrade

Displays a list of packages with newer versions available in the subscribed channels. Click the latest package name to view its Package Details page. To upgrade packages immediately, select them and click the Upgrade Packages button. Any EULAs will be accepted automatically.

#### Install

Install new packages on the system from the available channels. Click the package name to view its Package Details page. To install packages, select them and click the Install Selected Packages button. EULAs are automatically accepted.

#### Verify

Validates the packages installed on the system against its RPM database. This is the equivalent of running rpm -V. The metadata of the system's packages are compared with information from the database, such as file checksum, file size, permissions, owner, group and type. To verify a package or packages, select them, click the *Verify Selected Packages* button, and confirm. When the check is finished, select this action in the <u>History</u> subtab under Events to see the results.

#### Lock

Locking a package prevents modifications like removal or update of the package. Since locking and unlocking happens via scheduling requests, locking might take effect with some delay. If an update happens before then, the lock will have no effect. Select the packages you want to lock. If locking should happen later, select the date and time above the *Request Lock* button, then click it. A small lock icon marks locked packages. To unlock, select the package and click *Request Unlock*, optionally specifying the date and time for unlocking to take effect.

## Note

This feature only works if Zypper is used as the package manager. On the target machine the <u>zypp-plugin-spacewalk</u> package must be installed (version 0.9.x or higher).

#### Profiles

Compare installed packages with the package lists in stored profiles and other systems.

- Select a stored profile from the drop-down box and click the *Compare* button. To compare with packages installed on a different system, select the system from the associated drop-down box and click the *Compare* button.
- To create a stored profile based on the existing system, click the *Create System Profile* button, enter any additional information, and click the *Create Profile* button. These profiles are kept within the *Main menu > Systems > Stored Profiles* page.
  When installed packages have been compared with a profile, customers have the option to synchronize the selected system with the profile. All changes apply to the system not the profile. Packages might get deleted and additional packages installed on the system. To install only specific packages, click the respective check boxes in the profile. To remove specific packages installed on the system, select the check boxes of these packages showing a difference of This System Only.

To completely synchronize the system's packages with the compared profile, select the master check box at the top of the column. Then click the *Sync Packages to* button. On the confirmation screen, review the changes, select a time frame for the action, and click the *Schedule Sync* button.

You can use a stored profile as a template for the files to be installed on an autoinstalled system.

Non Compliant

Lists packages that are installed on this system and are not present in any of its channels.

### 7.3.2.3 System Details > Software > Software Channels

Software channels provide a well-defined method to determine which packages should be available to a system for installation or upgrade based on its operating systems, installed packages, and functionality.

| Patches Packages Software Channels SP Migration Se   | oftware Crashes  |
|--|--|
| n subscribing to a channel that contains a product, the product package will aut<br>s on Sait managed systems.   | omatically be installed on traditionally registered systems or added to the package  |
| We Base Channel<br>You can change the base software channel your system is subscribed to.<br>The system will be unsubscribed from all software channels, and<br>subscribed to the new base software channel. | This system is subscribed to the checked channels beneath, if any.<br>Disabled checkboxes indicate channels that can't be manually subscribed<br>or unsubscribed from. |
| © include recommended C (none, disable service)  | testchannel %  |
| Custom Channels  |  |
| ning: 'FastTrack' and Beta child software channels are not available with Extended   | ed Update Support.   |

Click the chain icon right to a channel name to view its <u>Channel Details</u> page. To change the base software channel the system is subscribed to select a different base channel in the left selection box.

To modify the child channels associated with this system, in the right selection box use the check boxes left to the channel names. If you enable <u>include</u> recommended, recommended child channels are automatically selected for subscription. Starting with SUSE Linux Enterprise 15,

child channels can depend on other channels-they are required. In the channel subscription you can see the dependencies by hovering with a mouse on a child channel name. Selecting a channel that depends on another channel will select this channel, too. Unselecting a channel on which some other channels depend will also unselect those channels.

When done click Next to schedule the Software Channel Change action. Then click Confirm.

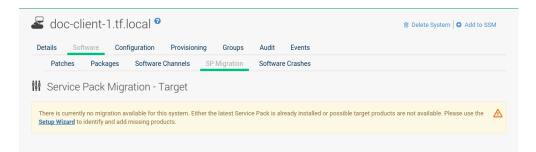

# Note: Changing the Channels Is Now an Action

Since the 3.1 maintenance update (2018) changing the channels is an action that can be scheduled like any other action. Earlier channel changes were applied immediately.

For more information about channel management, see Section 12.1, "Channels".

#### 7.3.2.4 System Details > Software > SP Migration

Service Pack Migration (SP Migration) allows you to upgrade a system from one service pack to another.

# Warning

During migration Uyuni automatically accepts any required licenses (EULAs) before installation.

Beginning with SLE 12 SUSE supports service pack skipping, it is now possible to migrate from for example, SLE 12 to SLE 12 SP2. Note that SLE 11 may only be migrated step by step and individual service packs should not be skipped. Supported migrations include any of the following:

- SLE 11 > SLE 11 SP1 > SLE 11 SP2 > SLE 11 SP3 > SLE 11 SP4
- SLE 12 > SLE 12 SP1 > SLE 12 SP2
- SLE 12 > SLE 12 SP2 (skipping SLE 12 SP1)

# Warning: Migrating from an Earlier Version of SLES

It is not possible to migrate, for example, from SLE 11 to SLE 12 using this tool. You must use AutoYaST to perform a migration on this level.

# Warning: Rollback Not Possible

The migration feature does not cover any rollback functionality. When the migration procedure is started, rolling back is not possible. Therefore it is recommended to have a working system backup available for an emergency.

#### PROCEDURE: PERFORMING A MIGRATION

- 1. From the Main Menu > Systems > Overview page, select a client.
- 2. Select the System Details > Software > SP Migration tabs.
- 3. Select the target migration path and click Select Channels.
- 4. From the System Details > Software > SP Migration > Service Pack Migration Channels view select the correct base channel, including Mandatory Child Channels and any additional Optional Child Channels. Select Schedule Migration when your channels have been configured properly.

#### System Details > Configuration [Management] 7.3.3

This tab and its subtabs assist in managing the configuration files associated with the system. These configuration files may be managed solely for the current system or distributed widely via a Configuration Channel. The following sections describe these and other available options on the System Details > Configuration subtabs.

## Note

To manage the configuration of a system, it must have the latest rhncfg\* packages installed. Refer to for instructions on enabling and disabling scheduled actions for a system.

This section is available to normal users with access to systems that have configuration management enabled. Like software channels, configuration channels store files to be installed on systems. While software updates are provided by SCC, configuration files are managed solely by you. Also unlike with software packages, various versions of configuration files may prove useful to a system at any time. Only the latest version can be deployed.

### 7.3.3.1 System Details > Configuration > Overview

This subtab provides access to the configuration files of your system and to the most common tasks used to manage configuration files.

#### **Configuration Overview**

From the *System Details* > *Configuration* > *Overview*, click the Add links to add files, directories, or symbolic links. Here you also find shortcuts to perform any of the common configuration management tasks listed on the right of the screen by clicking one of the links under *System Details* > *Configuration* > *Overview* > *Configuration Actions*.

|   |   |   |

## 7.3.3.2 System Details > Configuration > View/Modify Files

This subtab lists all configuration files currently associated with the system. These are sorted via subtabs in centrally and locally managed files and a local sandbox for files under development. Using the appropriate buttons on a subtab, you can copy from one to the other subtabs.

#### **Centrally-Managed Files**

Centrally-managed configuration files are provided by global configuration channels. Determine which channel provides which file by examining the <u>Provided By</u> column below. Some of these centrally-managed files may be overridden by locally-managed files. Check the <u>Overridden By</u> column to find out if any files are overridden, or click *Override this file* to provide such an overriding file.

| Details So | ftware    | Configuration | Provisioning       | Groups      | Audit       | Events |  |  |
|------------|-----------|---------------|--------------------|-------------|-------------|--------|--|--|
| Overview   | View      | /Modify Files | Add Files Mar      | age Configi | uration Cha | nnels  |  |  |
| Cent       | ally-Mana | ged Files Loc | ally-Managed Files | Local       | Sandbox     |        |  |  |
| 🖹 Configi  | aradon    |               |                    |             |             |        |  |  |

#### Locally-Managed Files

Locally-managed configuration files are useful for overriding centrally-managed configuration profiles that cause problems on particular systems. Also, locally-managed configuration files are a method by which system group administrators who do not have configuration administration privileges can manage configuration files on the machines they can manage.

|            |                   | Configuration | Provision   | ing Groups         | Audit        | Events |                 |  |

| figuration | iles are a method |               | group admir | nistrators who don |              |        | an manage confi |  |

#### Local Sandbox

In the sandbox you can store configuration files under development. You can promote files from the sandbox to a centrally-managed configuration channel using <u>Copy Latest to</u> <u>Central Channel</u>. After files in this sandbox have been promoted to a centrally-managed configuration channel, you can deploy them to other systems.

Use <u>Copy Latest to System Channel</u> to install a configuration on the local system only. When done, the file will end up on the Locally-Managed Files subtab.

## 7.3.3.3 System Details > Configuration > Add Files

To upload, import, or create new configuration files, open the Add Files subtab.

#### Upload File

To upload a configuration file from your local machine, browse for the upload file, specify whether it is a text or binary file, enter <u>Filename/Path</u> and user and group ownership. Specific file permissions can be set. When done, click *Upload Configuration File*.

| adoc-client-1.tf.local   | 0   |                          |   | Delete System                                     |

|  | End Delimiter:  | 0                        |   |   |
| N  | Note: Macro delimiters will be igno<br>Upload Configuration File  | red when deploying to    | systems managed via Salt.   |   |
|  |   |                          |   |   |

#### **Import Files**

Via the <u>Import Files</u> tab, you can add files from the system you have selected before and add it to the sandbox of this system. Files will be imported the next time <u>rhn\_check</u> runs on the system. To deploy these files or override configuration files in global channels, copy this file into your local override channel after the import has occurred.

In the text box under <u>Import New Files</u> enter the full path of any files you want import into Uyuni or select deployable configuration files from the <u>Import Existing Files</u> list. When done, click *Import Configuration Files*.

| A Permission Error.<br>You do not have the appropriate permission set to access the requested page. You may have reached this error page in one of several ways:   |

The SUSE Manager requires cookies in order to function; if you have disabled them, please re-enable them to use the site.</li> <li>You've done something naughty. Stop it.</li> </ol> |
|  |

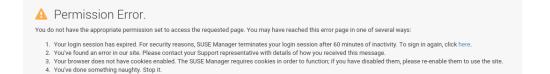

#### **Create File**

Under <u>Create File</u>, you can directly create the configuration file from scratch. Select the file type, specify the path and file name, where to store the file, plus the symbolic link target file name and path. Ownership and permissions and macro delimiters need to be set. For more information on using macros, see *Section 15.5.2.1, "Including Macros in your Configuration Files"*. In the <u>File Contents</u> text box, type the configuration file. Select the type of file you are creating from the drop-down box. Possible choices are Shell, Perl, Python, Ruby and XML. When done, click *Create Configuration File*.

# 7.3.3.4 System Details > Configuration > Deploy Files

Under Deploy Files you find all files that can be deployed on the selected system.

Files from configuration channels with a higher priority take precedence over files from configuration channels with a lower priority.

## 7.3.3.5 System Details > Configuration > Compare Files

This subtab compares a configuration file stored on the Uyuni with the file stored on the client. It does not compare versions of the same file stored in different channels.

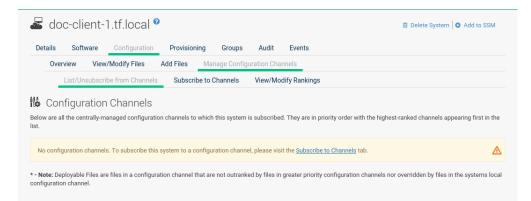

| A Permission Error.<br>You do not have the appropriate permission set to access the requested page. You may have reached this error page in one of several ways:   |
|--|
| <ol> <li>Your login session has expired. For security reasons, SUSE Manager terminates your login session after 60 minutes of inactivity. To sign in again, click here.</li> <li>You've found an error in our site. Please contact your Support representative with details of how you received this message.</li> <li>Your browser does not have cookies enabled. The SUSE Manager requires cookies in order to function; if you have disabled them, please re-enable them to use the site.</li> <li>You've done something naughty. Stop it.</li> </ol> |

Select the files to be compared, click the *Compare Files* button, select a time to perform the diff, and click the *Schedule Compare* button to confirm.

To watch progress, see *Section 7.3.10, "System Details > Events"*. After the diff has been performed, go to Recent Events in *Section 7.3.3.1, "System Details > Configuration > Overview"* to see the results.

### 7.3.3.6 System Details > Configuration > Manage Configuration Channels

This subtab allows you to subscribe to and rank configuration channels associated with the system, lowest first.

The List/Unsubscribe from Channels subtab contains a list of the system's configuration channel subscriptions. Click the check box next to the Channel and click <u>Unsubscribe</u> to remove the subscription to the channel.

The <u>Subscribe to Channels</u> subtab lists all available configuration channels. To subscribe to a channel, select the check box next to it and click *Continue*. To subscribe to all configuration channels, click <u>Select All</u> and click *Continue*. The <u>View/Modify Rankings</u> page automatically loads.

The <u>View/Modify Rankings</u> subtab allows users to set the priority with which files from a particular configuration channel are ranked. The higher the channel is on the list, the more its files take precedence over files on lower-ranked channels. For example, the higher-ranked channel may have an <u>httpd.conf</u> file that will take precedence over the same file in a low-er-ranked channel.

# 7.3.4 System Details > Provisioning [Management]

The <u>Provisioning</u> tab and its subtabs allow you to schedule and monitor AutoYaST or Kickstart installations and to restore a system to its previous state.

# Note: Available for Clients Using the "Traditional" Method

The note <u>Provisioning</u> tab will be available when adding a client using the "traditional" method (system type <u>management</u>). Using Salt the <u>Provisioning</u> tab will not be available (system type <u>salt</u>).

AutoYaST is a SUSE Linux Enterprise and Kickstart is a Red Hat utility-both allow you to automate the reinstallation of a system. Snapshot rollbacks provide the ability to revert certain changes on the system. You can roll back a set of RPM packages, but rolling back across multiple update levels is not supported. Both features are described in the sections that follow.

## 7.3.4.1 System Details > Provisioning > Autoinstallation

The <u>Schedule</u> subtab allows you to configure and schedule an autoinstallation for this system. For background information about autoinstallation, see *Chapter 8, Autoinstallation*.

| No profiles found that are compatible with this System. Either you haven't created any Autoinstallation Profiles or this system does not have a Base Channel.   | Ð |

| No profiles currently available for autoinstallation. Please create a new kickstart profile. Tip: *- Profiles that are not SUSE Manager-managed are not guaranteed to register systems to SUSE Manager after autoinstallation. You may wish to review these autoinstallations (click on the profile name to do so) to confirm whether or not your system will reappear in the SUSE Manager system list after autoinstallation. Select SUSE Manager Proxy You may choose to use an SUSE Manager Proxy to access the files necessary for autoinstallation. This system will be registered to the SUSE Manager Proxy selected below after its autoinstallation has completed.                                    |   |

In the <u>Schedule</u> subtab, schedule the selected system for autoinstallation. Choose from the list of available profiles.

# Note

You must first create a profile before it appears on this subtab. If you have not created any profiles, refer to *Section 8.3.1, "Create a Kickstart Profile"*. before scheduling an autoinstallation for a system.

To alter autoinstallation settings, click the *Advanced Configuration* button. Configure the network connection and post-installation networking information. You can aggregate multiple network interfaces into a single logical "bonded" interface. In <u>Kernel Options</u> specify kernel options to be used during autoinstallation. <u>Post Kernel Options</u> are used after the installation is complete and the system is booting for the first time. Configure package profile synchronization. Select a time for the autoinstallation to begin and click *Schedule Autoinstall and Finish* for all changes to take effect and to schedule the autoinstallation.

Alternatively, click <u>Create PXE Installation Configuration</u> to create a Cobbler system record. The selected autoinstallation profile will be used to automatically install the configured distribution next time that particular system boots from PXE. In this case Uyuni and its network must be properly configured to allow boot using PXE.

## Note

Any settings changed on the <u>Advanced Configuration</u> page will be ignored when creating a PXE installation configuration for Cobbler.

The <u>Variables</u> subtab can be used to create Kickstart variables, which substitute values in Kickstart files. To define a variable, create a name-value pair (name/value) in the text box.

For example, to {kickstart} a system that joins the network of a specific organization (for example the Engineering department) you can create a profile variable to set the IP address and the gateway server address to a variable that any system using that profile will use. Add the following line to the Variables text box:

```
IPADDR=192.168.0.28
GATEWAY=192.168.0.1
```

To use the system variable, use the name of the variable in the profile instead of the value. For example, the network portion of a {kickstart} file could look like the following:

```
network --bootproto=static --device=eth0 --onboot=on --ip=$IPADDR \
    --gateway=$GATEWAY
```

The \$IPADDR will be 192.168.0.28, and the \$GATEWAY will be 192.168.0.1.

# Note

There is a hierarchy when creating and using variables in {kickstart} files. System {kickstart} variables take precedence over profile variables, which in turn take precedence over distribution variables. Understanding this hierarchy can alleviate confusion when using variables in {kickstart}.

Using variables are one part of the larger Cobbler infrastructure for creating templates that can be shared between multiple profiles and systems. For more information about Cobbler and {kickstart} templates, refer to *Book "Advanced Topics", Chapter 10 "Cobbler"*.

### 7.3.4.2 System Details > Provisioning > Power Management

Uyuni allows you to power on, off, and reboot systems via the IPMI protocol if the systems are IPMI-enabled.

| doc-client-1.tf.loca       | al 🤨   | Delete System O Add to SSM        |
|----------------------------|--|-----------------------------------|
| Details Software Configura | tion Provisioning Groups Audit Events  |                                   |
| Power Management           |  |                                   |
| Power Management S         | Settings 🛛   |                                   |
| Туре *                     | IPMI   NOTE: IPMI is the only power management type that has been tested and is supported, but others may work. To enable other power management types override the "java.power_management.types" option in rhn.conf.  |                                   |
| Network address            | The hostname or IP address of the power management server.   |                                   |
| Username                   | The username used to log in to the power management server.  |                                   |
| Password                   | The password used to log in to the power management server.  |                                   |
| System identifier          | The identifier used to specify this system on the power management server. Optional<br>because not all power managment types will need this field. This field can also be<br>used to pass additional options to the "fence agent". For example, if you are using an<br>IPMI server that requires the Lanplus protocol (and this system's identifier was<br>"System") then you can set a System identifier of *P System" to instruct<br>fence_ipmilan to use the Lanplus protocol for this system. See the fence agent's<br>documentation for additional options. |                                   |
| Current power status       | Unknown<br>on this page is available to anyone on the network. See cobbler documentation for more infor  | mation and mitigation strategies. |
| Save and                   | E Get status O Power On Power Off C Reboot   |                                   |

You need a fully patched Uyuni installation. To use any power management functionality, IPMI configuration details must be added to Uyuni. First select the target system on the systems list, then select *Provisioning* > *Power Management*. On the displayed configuration page, edit all required fields (marked with a red asterisk) and click *Save only*.

Systems can be powered on, off, or rebooted from the configuration page via corresponding buttons. Note that any configuration change is also saved in the process. The *Get Status* button can be used to query for the system's power state. If configuration details are correct, a row is displayed with the current power status ("on" or "off"). If a power management operation succeeds on a system, it will also be noted in its *System Details > Events > History* subtab.

Power management functionalities can also be used from the system set manager to operate on multiple systems at the same time. Specifically, you can change power management configuration parameters or apply operations (power on, off, reboot) to multiple systems at once:

- 1. Add the respective systems to the system set manager as described in Section 7.5, "Systems > System Set Manager".
- 2. Select systems on the *Main Menu* > *Systems* > *Overview*, then *Main Menu* > *System Set Manager* > *Provisioning* > *Power Management Configuration* to change one or more configuration parameters for all systems in the set. Note that any field left blank will not alter the configuration parameter in selected systems.
- 3. When all configuration parameters are set correctly, click *Main Menu > Systems > System Set Manager > Provisioning > Power Management Operations* to power on, off or reboot systems from the set.

To check that a power operation was executed correctly, click *Main Menu* > *Systems* > *System Set Manager* > *Status*, then click the proper line in the list. This will display a new list with systems to which the operation was applied. If errors prevent correct execution, a brief message with an explanation will be displayed in the Note column.

This feature uses Cobbler power management, thus a Cobbler system record is automatically created at first use if it does not exist already. In that case, the automatically created system record will not be bootable from the network and will reference a dummy image. This is needed because Cobbler does not currently support system records without profiles or images. The current implementation of Cobbler power management uses the fence-agent tools to support multiple protocols besides IPMI. Those are not supported by Uyuni but can be used by adding the fence agent names as a comma-separated list to the <code>java.power\_management.types</code> configuration parameter.

## 7.3.4.3 System Details > Provisioning > Snapshots

Snapshots enable you to roll back the system's package profile, configuration files, and Uyuni settings.

Snapshots are always captured automatically after an action takes place. The Snapshots subtab lists all snapshots for the system, including the reason the snapshot was taken, the time it was taken, and the number of tags applied to each snapshot.

# Note: Technical Details

- A snapshot is always taken after a successful operation and not before, as you might expect. One consequence of taking snapshots after the action is that, to undo action number X, then you must roll back to the snapshot number X-1.
- It is possible to disable snapshotting globally (in rhn.conf set enable\_snapshots = 0), but it is enabled by default. No further fine tuning is possible.

To revert to a previous configuration, click the Reason for the snapshot and review the potential changes on the provided subtabs, starting with Rollback.

# Important: Unsupported Rollback Scenarios

Snapshot roll backs support the ability to revert certain changes to the system, but not in every scenario. For example, you can roll back a set of RPM packages, but rolling back across multiple update levels is not supported.

Rolling back an SP migration is also not supported.

Each subtab provides the specific changes that will be made to the system during the rollback:

- group memberships,
- channel subscriptions,
- installed packages,
- configuration channel subscriptions,
- configuration files,
- snapshot tags.

When satisfied with the reversion, return to the Rollback subtab and click the Rollback to Snapshot button. To see the list again, click Return to snapshot list.

# Note: Background Information About Snapshots

There is no maximum number of snapshots that Uyuni will keep, thus related database tables will grow with system count, package count, channel count, and the number of configuration changes over time. Installations with more than a thousand systems should consider setting up a recurring cleanup script via the API or disabling this feature altogether.

There is currently no integrated support for "rotated snapshots".

Snapshot rollback gets scheduled like any other action, this means the rollback usually does not happen immediately.

#### System Details > Provisioning > Snapshot Tags 7.3.4.4

Snapshot tags provide a means to add meaningful descriptions to your most recent system snapshot. This can be used to indicate milestones, such as a known working configuration or a successful upgrade.

To tag the most recent snapshot, click Create System Tag, enter a descriptive term in the Tag name, and click the Tag Current Snapshot button. You may then revert using this tag directly by clicking its name in the Snapshot Tags list. To delete tags, select their check boxes, click Remove Tags, and confirm the action.

## 7.3.5 System Details > Groups

The Groups tab and its subtabs allow you to manage the system's group memberships.

#### 7.3.5.1 System Details > Groups > List/Leave

This subtab lists groups to which the system belongs and enables you to cancel membership.

The <u>Virtualization</u> tab has three subtabs, <u>Details</u>, <u>Provisioning</u>, and <u>Deployment</u>. These tabs appear the same for both virtual hosts and guests, but the functionality only makes sense for virtual hosts. It is not possible to create a guest system that runs on another guest system.

#### System Details > Virtualization> Details

Details is the default tab. For host systems, it presents a table of the host system's virtual guests. For each guest system, the following information is provided:

#### Status

This field indicates whether the virtual system is running, paused, stopped, or has crashed.

#### Updates

This field indicates whether patches (errata) applicable to the guest have yet to be applied.

#### Base Software Channel

This field indicates the Base Channel to which the guest is subscribed.

# Note

If a guest system has not registered with Uyuni, this information appears as plain text in the table.

If you have System Group Administrator responsibilities assigned for your guest systems, a user might see the message You do not have permission to access this system in the table. This is because it is possible to assign virtual guests on a single host to multiple System Group Administrators. Only users that have System Group Administrator privileges on the host system may create new virtual guests.

### 7.3.6.1 System Details > Virtualization > Deployment

In the *System Details* > *Virtualization* tab of a traditionally registered bare-metal machine, there is a *System Details* > *Virtualization* > *Deployment* subtab. This form expects a URL to a <u>qcow2</u> type of image and some other parameters allowing the user to schedule the deployment of that image.

# 7.3.8 System Details > States [Salt]

Overview of States subtabs.

# Note

The following subtabs are only available for Salt minions.

#### 7.3.8.1 System Details > States > Packages

Search and install packages then assign them with a pre-defined state for a selected machine.

| ails    | Software  | Configuration | Provisioning    | Groups         | Audit | States | Formulas | Events |   |            |
|---------|-----------|---------------|-----------------|----------------|-------|--------|----------|--------|---|------------|
| Highsta | te Packa  | ges Configu   | ration Channels |                |       |        |          |        |   |            |
| 'acka   | ge States | 5             |                 |                |       |        |          |        |   | Save       |
|         |           |               |                 |                |       |        |          | Orach  | 0 |            |
|         |           |               |                 | Search package |       |        |          | Search |   | No Changes |

Here you can search for a specific package, for example vim. Then with the drop-down box activate <u>Unmanaged</u>, <u>Installed</u>, or <u>Removed</u>. Select <u>Latest</u> or <u>Any</u> from the drop-down box. <u>Latest</u> applies the latest package version available while <u>Any</u> applies the package version required to fulfil dependencies. Click the *Save* button to save changes to the database, then click *Apply* to apply the new package state.

#### 7.3.8.2 System Details > States > Custom

States which have been created on the <u>States Catalog</u> page located under *Main Menu > Salt* may be assigned to a system on the Custom page.

| tails Software | Configu | ration   | Provisioning   | Groups         | Audit       | States | Formulas | Events |        |                     |
|----------------|---------|----------|----------------|----------------|-------------|--------|----------|--------|--------|---------------------|
| Highstate Pao  | ckages  | Configur | ation Channels |                |             |        |          |        |        |                     |
| Configuratio   | on onan | neio     |                |                |             |        |          |        |        |                     |
|                |         |          |                |                |             |        |          |        |        | Apply               |
|                |         |          | Se             | arch in config | uration cha | nnels  |          | Search | System | Apply<br>No Changes |

Search for the custom state you want to apply to the system then select the <u>Assign</u> check box. Click *Save* to save the change to the database finally select *Apply* to apply the changes. States applied at the system level will only be applied to the selected system.

#### 7.3.8.3 System Details > States > Highstate

From the <u>Highstate</u> page you can view and apply the highstate for a selected system. Select the *Test mode* toggle to test the highstate before applying it.

#### USING TEST MODE

- 1. Select the toggle *Test mode*.
- 2. Select Apply Highstate.
- 3. You will see the message:

Applying the highstate has been scheduled.

4. Select scheduled to see the results of the test.

Select a date and time to apply the highstate. Then click Apply Highstate.

## 7.3.9 System Details > Formulas [Salt]

This is a feature preview. On the Formualas page you can select Salt formulas for this system. This allows you to automatically install and configure software.

Installed formulas are listed. Select from the listing by clicking the check box to the left. Then confirm with the *Save* button on the right. When done, additional subtabs appear where you can configure the formulas.

For usage information, see Book "Best Practices", Chapter 4 "Salt Formulas and Uyuni", Section 4.9 "Using Salt Formulas with Uyuni".

## 7.3.10 System Details > Events

The <u>Events</u> page displays past, current, and scheduled actions on the system. You may cancel pending events here. The following sections describe the <u>Events</u> subtabs and the features they offer.

### 7.3.10.1 System Details > Events > Pending

Lists events that are scheduled but have not started.

| Details Software Configuration<br>Pending History Pending Events                         | Provisioning Groups Audit Events  |                      |

|  |   |                      |
|  |   | Cancel Selected Ever |
|  |   |                      |
| ype Summary  | Earliest Occurrence   |                      |
| and an and a summary   |   |                      |

A prerequisite action must complete successfully before the given action is attempted. If an action has a prerequisite, no check box is available to cancel that action. Instead, a check box appears next to the prerequisite action; canceling the prerequisite action causes the action in question to fail.

Actions can be chained so that action 'a' requires action 'b' which requires action 'c'. Action 'c' is performed first and has a check box next to it until it is completed successfully. If any action in the chain fails, the remaining actions also fail. To unschedule a pending event, select the event and click the *Cancel Selected Events* button. The following icons indicate the type of events:

tem Event.

### 7.3.10.2 System Details > Events > History

The default display of the <u>Events</u> tab lists the type and status of events that have failed, occurred or are occurring.

| Details                 | Software                | Configuration       | Provisioning         | Groups          | Audit      | Events               |                          |              |                             |

To view details of an event, click its summary in the <u>System History</u> list. To go back to the table again, click *Return to history list* at the bottom of the page.

# 7.4 Systems > System Groups

The System Groups page allows Uyuni users to view the System Groups list.

| 🔁 System G              | Groups <sup>©</sup>    |         |            | + Create Group |
|-------------------------|------------------------|---------|------------|----------------|
| Work With Union         | Work With Intersection |         |            |                |
| Updates                 | Group Name             | Systems | Use in SSM |                |
| Your organization has n | io system groups.      |         |            |                |
|                         |                        |         |            | Download CSV   |

Only System Group Administrators and Uyuni Administrators may perform the following additional tasks:

- 1. Create system groups. (Refer to Section 7.4.1, "Creating Groups".)
- 2. Add systems to system groups. (Refer to Section 7.4.2, "Adding and Removing Systems in Groups".)

- 3. Remove systems from system groups. (Refer to Section 7.3, "System Details".)
- 4. Assign system group permissions to users. (Refer to Chapter 17, Users.)

The <u>System Groups</u> list displays all system groups. The list contains several columns for each group:

- <u>Select</u> Via the check boxes add all systems in the selected groups to the <u>System Set</u> <u>Manager</u> by clicking the *Update* button. All systems in the selected groups are added to the <u>System Set Manager</u>. You can then use the <u>System Set Manager</u> to perform actions on them simultaneously. It is possible to select only those systems that are members of all of the selected groups, excluding those systems that belong only to one or some of the selected groups. To do so, select the relevant groups and click the *Work with Intersection* button. To add all systems of all selected groups, click the *Work with Union* button. Each system will show up once, regardless of the number of groups to which it belongs. Refer to *Section 7.5, "Systems > System Set Manager"* for details.
- <u>Updates</u> Shows which type of patch alerts are applicable to the group or confirms that all systems are up-to-date. Clicking a group's status icon takes you to the <u>Patch</u> tab of its <u>System Group Details</u> page. Refer to *Section 7.4.3, "System Group Details"* for more information.

— Critical patches available, update *strongly* recommended. \*\*

The status icons call for differing degrees of attention:

are up-to-date.

— Updates available and recommended.

- Health Status of the systems in the group, reported by probes.
- <u>Group Name</u> The name of the group as configured during its creation. The name should be explicit enough to distinguish from other groups. Clicking the name of a group takes you to the <u>Details</u> tab of its <u>System Group Details</u> page. Refer to Section 7.4.3, "System Group Details" for more information.

— All systems in the group

- <u>Systems</u> Total number of systems in the group. Clicking the number takes you to the <u>Systems</u> tab of the <u>System Group Details</u> page for the group. Refer to *Section 7.4.3, "System Group Details"* for more information.
- Use in SSM Clicking the Use in SSM link in this column loads all and only the systems in the selected group and launches the System Set Manager immediately. Refer to Section 7.5, "Systems > System Set Manager" for more information.

# 7.4.1 Creating Groups

To add a new system group, click the Create Group link at the top-right corner of the page.

| Create System G | roup<br>ovided. Note that the group will be empty until systems are joined to it. Entries marked with an asterisk (*) are <b>required</b> . |
|-----------------|---|
| Name *          |   |
| Description *   |   |
|                 | <i>b</i>  |
|                 | Create Group  |

Type a name and description and click the *Create Group* button. Make sure you use a name that clearly sets this group apart from others. The new group will appear in the <u>System Groups</u> list.

# 7.4.2 Adding and Removing Systems in Groups

Systems can be added and removed from system groups. Clicking the group name takes you to the <u>Details</u> page. The <u>Systems</u> tab shows all systems in the group and allows you to select some or all systems for deletion. Click *Remove Systems* to remove the selected systems from the group. The <u>Target Systems</u> page shows you all systems that can be added to the group. Select the systems and click the *Add Systems* button.

## 7.4.3 System Group Details

At the top of each <u>System Group Details</u> page are two links: <u>Delete Group</u> and <u>Work With</u> <u>Group</u>. Clicking <u>Delete Group</u> deletes the System Group and should be used with caution. Clicking <u>Work With Group</u> loads the group's systems and launches the <u>System Set Manager</u> immediately like the <u>Use Group</u> button from the <u>System Groups</u> list. Refer to Section 7.5, "Systems > System Set Manager" for more information.

The System Group Details page is split into the following tabs:

### 7.4.3.1 *System Group Details > Details*

Provides the group name and group description. To change this information, click <u>Edit These</u> Properties, make your changes in the appropriate fields, and click the *Update Group* button.

### 7.4.3.2 System Group Details > Systems

Lists all members of the system group. Clicking links within the table takes you to corresponding tabs within the <u>System Details</u> page for the associated system. To remove systems from the group, select the appropriate check boxes and click the *Remove Systems* button on the bottom of the page. Clicking it does not delete systems from Uyuni entirely. This is done through the <u>System Set Manager</u> or <u>System Details</u> pages. Refer to *Section 7.5, "Systems > System Set Manager"* or *Section 7.3, "System Details"*, respectively.

### 7.4.3.3 System Group Details > Target Systems

<u>Target Systems</u> — Lists all systems in your organization. To add systems to the specified system group, click the check boxes to their left and click the *Add Systems* button on the bottom right-hand corner of the page.

### 7.4.3.4 System Group Details > Patches

List of relevant patches for systems in the system group. Clicking the advisory takes you to the <u>Details</u> tab of the <u>Patch Details</u> page. (Refer to *Section 11.2.2, "Patch Details"* for more information.) Clicking the Affected Systems number lists all of the systems affected by the patch. To apply the patch updates in this list, select the systems and click the *Apply Patches* button.

## 7.4.3.5 System Group Details > Admins

List of all organization users that have permission to manage the system group. Uyuni Administrators are clearly identified. System Group Administrators are marked with an asterisk ('\*'). To change the system group's users, select and deselect the appropriate check boxes and click the *Update* button.

## 7.4.3.6 System Group Details > States [Salt]

The <u>States</u> tab displays states which have been created and added using the *Salt* > *]* > *menu:State Catalog[*. From this page you can select which states should be applied across a group of systems. A state applied from this page will be applied to all minions within a group.

## Note

States are applied according to the following order of hierarchy within Uyuni:

Organization > Group > Single System

#### PROCEDURE: APPLYING STATES AT THE GROUP LEVEL

- 1. Create a state using the *Salt* > *State Catalog* or via the command line.
- 2. Browse to *Main Menu* > *Systems* > *System Groups*. Select the group that a new state should be applied to. From a specific group page select the States tab.
- 3. Use the search feature to located a state by name or click the *Search* button to list all available states.
- 4. Select the check box for the state to be applied and click the *Save* button. The *Save* button will save the change to the database but will not apply the state.
- 5. Apply the state by clicking the *Apply* button. The state will be scheduled and applied to any systems included within a group.

# 7.5 Systems > System Set Manager

The following actions executed on individual systems from the System Details page may be performed for multiple systems via the System Set Manager. The System Set Manager can be used to schedule actions on both Salt and Traditional systems. The following table provides information on what actions may be performed across both Salt and Traditional systems. These two methods have different actions which may be accessed with the System Set Manager:

| System Set Manager:<br>Overview   | Traditional SSM   | Salt SSM  |
|---|---|---|
| Systems: * List Systems   | Supported * Supported   | Supported * Supported   |
| Install Patches: * Schedule<br>Patch Updates  | Supported * Supported   | Supported * Supported   |
| Install Packages: * Upgrade *<br>Install * Remove * Verify  | Supported * Supported *<br>Supported * Supported *<br>Supported               | Limited * Supported * Sup-<br>ported * Supported * Not<br>Available           |
| Groups: * Create * Manage   | Supported * Supported *<br>Supported  | Supported * Supported *<br>Supported  |
| Channels: * Channel Mem-<br>berships * Channel Subscrip-<br>tions * Deploy / Diff Chan-<br>nels   | Supported * Supported *<br>Supported * Supported                              | Limited * Supported * Not<br>Available * Not Available                        |
| Provisioning: * Autoinstall<br>Systems * Tag for Snapshot *<br>Remote Commands * Power<br>Management * Power Man-<br>agement Operations       | Supported * Supported *<br>Supported * Supported *<br>Supported * Supported   | Not Available   |
| Misc: * Update System Pref-<br>erences * Update Hardware<br>Profiles * Update Package<br>Profiles * Run Remote Com-<br>mands * Set and Remove | Supported * Supported *<br>Supported * Supported *<br>Supported * Supported * | Supported * Supported *<br>Supported * Supported *<br>Supported * Supported * |

| System Set Manager:<br>Overview | Traditional SSM         | Salt SSM                |
|---------------------------------|-------------------------|-------------------------|
| Custom Values for Selected      | Supported * Supported * | Supported * Supported * |
| Systems * Reboot Systems *      | Supported * Supported * | Supported * Supported * |
| Migrate Systems to another      | Supported               | Supported               |
| Organization * Delete Sys-      |                         |                         |
| tems from SUSE Manager          |                         |                         |

Before performing actions on multiple systems, select the systems to work with. To select systems, click *Main Menu > Systems > Systems > All* and check the boxes to the left of the systems you want to work with.

Additionally, you can access the System Set Manager in three different ways:

- 1. Click the Main Menu > System Set Manager.
- 2. Click the Use in SSM link in the Main Menu > Systems > System Groups.
- 3. Click the Work with Group link on the System Group Details page.

## 7.5.1 System Set Manager > Overview

This page contains links to most SSM option tabs with short explanations.

Click the number in the Systems column to see to which systems in the System Set Manager a patch applies. To apply updates, select the patches and click the *Apply Patches* button.

## 7.5.4 System Set Manager > Packages

Click the number in the Systems column to see the systems in the System Set Manager to which a package applies. Modify packages on the system via the following subtabs.

### 7.5.4.1 System Set Manager > Packages > Install

This list includes all channels to which systems in the set are subscribed. A package is only installed on a system if the system is subscribed to the channel providing the package.

| 🗣 Syst                         | em Set  | Manage         | er Overv          | iew 🕫         |                  |               |              |       |      |
|--------------------------------|---------|----------------|-------------------|---------------|------------------|---------------|--------------|-------|------|
| Overview                       | Systems | Patches        | Packages          | Groups        | Channels         | Configuration | Provisioning | Audit | Misc |
| Upgrad                         | Install | Remove         | Verify            |               |                  |               |              |       |      |

Systems must be subscribed to a channel providing the packages to be upgraded. If multiple versions of a package are available, note that your system will be upgraded to the latest version. Select the packages to be upgraded, then click the *Upgrade Packages* button.

## 7.5.4.4 System Set Manager > Packages > Verify

A list of all installed packages whose contents, file checksum, and other details may be verified.

| verview  | Systems | Patches | Packages         | Groups         | Channels         | Configuration               | Provisioning               | Audit                   | Misc   |
|--|---------|---------|------------------|----------------|------------------|-----------------------------|----------------------------|-------------------------|--|
| Upgrade  | Install | Remove  | Verify           |                |                  |                             |                            |                         |  |
|  |         |         |                  |                |                  |                             |                            |                         |  |
| vrifiable  | Package | S       |                  |                |                  |                             |                            |                         |  |
| erifiable  | Package | S       |                  |                |                  |                             |                            |                         |  |
|  | 5       |         | or more system   | ns. Select one | or more and clic | k the <b>Verify Selecte</b> | I Packages button t        | o schedule p            | package verification.                            |
|  | 5       |         | or more system   | ns. Select one | or more and clic | k the Verify Selecte        | I Packages button t        | o schedule p            | package verification.                            |
|  | 5       |         | or more system   | ns. Select one | or more and clic | k the Verify Selecte        | <b>l Packages</b> button t | o schedule p            | package verification.<br>Verify Selected Package |
| /erifiable  <br>ackages listed b<br>Package Name | 5       |         | e or more system |                | or more and clic | k the Verify Selecte        | I Packages button t        | o schedule p<br>Systems | -  |

At the next check in, the verify event issues the command <u>rpm</u> --verify for the specified package. If there are any discrepancies, they are displayed in the System Details page for each system.

Select the check box next to all packages to be verified, then click the *Verify Packages* button. On the next page, select a date and time for the verification, then click the *Schedule Verifications* button.

# 7.5.5 System Set Manager > Groups

Tools to create groups and manage system memberships.

|  |                   |                    |               |          |               |              |       | Alter Member |

|  |                   |                    |               |          |               |              |       |              |

These functions are limited to Uyuni Administrators and System Group Administrators. To add a new group, click Create Group on the top-right corner. In the next page, type the group name and description in the respective fields and click the Create Group button. To add or remove selected systems in any of the system groups, toggle the appropriate radio buttons and click the Alter Membership button.

#### System Set Manager > Channels 7.5.6

As a Channel Administrator, you may change the base channels your systems are subscribed to.

# Note: Changing the Channels Is Now an Action

Since the 3.1 maintenance update (2018) changing the channels is an action that can be scheduled like any other action. Earlier channel changes were applied immediately.

Manage channel associations through the following wizard procedure:

#### Base Channel Alteration (Page 1)

Valid channels are either channels created by your organization, or the vendor's default base channel for your operating system version and processor type. Systems will be unsubscribed from all channels, and subscribed to their new base channels.

# Warning: Changing Base Channel

This operation can have a dramatic effect on the packages and patches available to the systems. Use with caution.

|               |                                    |                |                   |              |                 |                         |                        |               |  |         |
|               |                                    |                |                   |              |                 |                         |                        |               | Confirm Subscri  | ptions  |

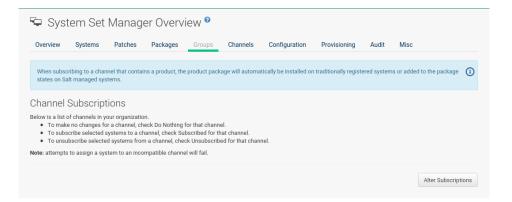

To change the base channel, select the new one from the <u>Desired base Channel</u> and confirm the action.

On the this wizard page you see the <u>Current base Channel</u> and how many <u>Systems</u> are subscribed to it. Click the number link in the <u>Systems</u> column to see which systems are actually selected.

To change the base channel subscription select the <u>Desired base Channel</u> from the selection box. Then click *Next* in the lower left corner.

#### Child Channels (Page 2)

The <u>Child Channels</u> page allows you to subscribe and unsubscribe individual child channels related to its parent or base channel. Systems must subscribe to a base channel before subscribing to a child channel. If you enable *with recommended*, recommended child channels are automatically selected for subscription. The handling of required channels is currently not implemented for system set manager.

Change the child channel subscription on this page. Then click Next in the lower left corner.

#### Channel Changes Overview (Page 3)

Schedule when the channel changes should take place the earliest. Then click *Confirm* in the lower left corner.

Channel Changes Actions (Page 4)

See the scheduled change actions.

# 7.5.7 System Set Manager > Configuration

Like in the *System Details* > *Channels* > *Configuration* tab, the subtabs here can be used to subscribe the selected systems to configuration channels and deploy and compare the configuration files on the systems. The channels are created in the <u>Manage Config Channels</u> interface within the *Main Menu* > *Software* category. Refer to *Section 15.3, "Overview"* for channel creation instructions. To manage the configuration of a system, install the latest <u>rhncfg\*</u> packages. Refer to *Section 15.2, "Preparing Systems for Configuration Management [Management]"* for instructions on enabling and disabling scheduled actions for a system.

#### 7.5.7.1 System Set Manager > Configuration > Deploy Files

Use this subtab to distribute configuration files from your central repository on Uyuni to each of the selected systems.

The table lists the configuration files associated with any of the selected systems. Clicking its system count displays the systems already subscribed to the file.

To subscribe the selected systems to the available configuration files, select the check box for each wanted file. When done, click *Deploy Configuration* and schedule the action. Note that the latest versions of the files, at the time of scheduling, are deployed. Newer versions created after scheduling are disregarded.

#### 7.5.7.2 System Set Manager > Configuration > Compare Files

Use this subtab to validate configuration files on the selected systems against copies in your central repository on Uyuni.

| 🗣 Syst                               | em Set    | Manag       | er Overvi         | iew 🕫          |                   |                     |                    |                |                                    |
|--------------------------------------|-----------|-------------|-------------------|----------------|-------------------|---------------------|--------------------|----------------|------------------------------------|

| Deploy                               | Files Cor | mpare Files | Subscribe to      | Channels       | Unsubscribe       | from Channels       | Enable Configur    | ation          |                                    |
| 🖨 Comp                               | are Conf  | iguration   | Files             |                |                   |                     |                    |                |                                    |
| The following c<br>of the files on t |           |             | ed with the syste | ems in this se | t. You can select | files and compare t | he SUSE Manager-n  | nanaged ver    | sions of the files to the versions |
| The comparison<br>accessible from    |           |             | mplete until eacl | h system cheo  | ks in to SUSE M   | anager. Once each c | comparison is comp | lete, any diff | ferences between the files will be |
| No configuratio                      | on files. |             |                   |                |                   |                     |                    |                |                                    |

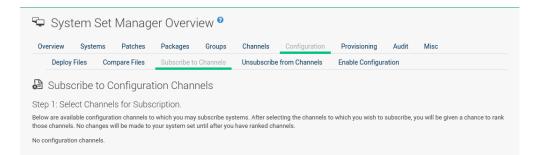

The table lists the configuration files associated with any of the selected systems. Clicking a file's system count displays the systems already subscribed to the file.

To compare the configuration files deployed on the systems with those in Uyuni, select the check box for each file to be validated. Then click *Analyze Differences > Schedule File Comparison*. The comparisons for each system will not complete until each system checks in to Uyuni. When each comparison is complete, any differences between the files will be accessible from each system's events page.

Note that the latest versions of the files, at the time of scheduling, are compared. Newer versions created after scheduling are disregarded. Find the results in the main *Main Menu* > *Schedule* category or within the *System Details* > *Events* tab.

#### 7.5.7.3 System Set Manager > Configuration > Subscribe to Channels

Subscribe systems to configuration channels, and in a second step rank these channels according to the order of preference. This tab is available only to Uyuni Administrators and Configuration Administrators.

- 1. Select channels for subscription by activating the check box. When done, confirm with *Continue*.
- 2. In the second step, rank the channels with the arrow-up or arrow-down symbols.

Then decide how the channels are applied to the selected systems. The three buttons below the channels reflect your options. Clicking Subscribe with Highest Priority places all the ranked channels before any other channels to which the selected systems are currently subscribed. Clicking Subscribe With Lowest Priority places the ranked channels after those channels to which the selected systems are currently subscribed. Clicking Replace Existing Subscriptions removes any existing association and creates new ones with the ranked channels, leaving every system with the same configuration channels in the same order.

# Note: Confliction Ranks

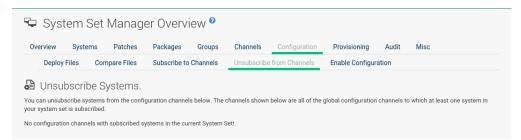

In the first two cases, if any of the newly ranked configuration channels are already in a system's existing configuration channel list, the duplicate channel is removed and replaced according to the new rank, effectively reordering the system's existing channels. When such conflicts exist, you are presented with a confirmation page to ensure the intended action is correct. When the change has taken place, a message appears at the top of the page indicating the update was successful.

Then, click Apply Subscriptions.

Channels are accessed in the order of their rank. Your local configuration channel always overrides all other channels.

#### System Set Manager > Configuration > Unsubscribe from Channels 7.5.7.4

Administrators may unsubscribe systems from configuration channels by clicking the check box next to the channel name and clicking the Unsubscribe Systems button.

#### System Set Manager > Configuration > Enable Configuration 7.5.7.5

Registered systems without configuration management preparation will appear here in a list.

| ÷               | Syst                     | em S                 | Set                 | Manag                              | er Overv   | iew 🛛        |          |
|-----------------|--------------------------|----------------------|---------------------|------------------------------------|--|--------------|----------|
| Ove             | erview                   | Syste                | ms                  | Patches                            | Packages   | Groups       | Channels |
|                 | Deploy                   | Files                | Con                 | npare Files                        | Subscribe to                                     | Channels     | Unsubscr |
| The s<br>config | ystems lis<br>guration m | sted belo<br>nanagem | w do n<br>ient, the | ot have files m<br>ey will need to | lanageme<br>nanaged via SUS<br>have particular i | E Manager co | 0        |
|                 | appen to a<br>on-manage  | ,                    |                     | systems.                           |  |              |          |

Administrators may enable configuration management by clicking the *Enable SUSE Manager Configuration Management* button. You can also schedule the action by adjusting the <u>Schedule</u> <u>no sooner than</u> date and time setting using the drop-down box, then clicking *Enable SUSE Manager Configuration Management*.

Then the systems will get subscribed to the required Uyuni tools channel and required rhncfg\* packages will get installed.

# 7.5.8 System Set Manager > Provisioning

Set the options for provisioning systems via the following subtabs.

#### 7.5.8.1 System Set Manager > Provisioning > Autoinstallation

Use this subtab to reinstall clients.

| 🔁 System Set Manager Overview 🎱 |             |                   |                    |                |                  |             |     |                  |           |      |
|---------------------------------|-------------|-------------------|--------------------|----------------|------------------|-------------|-----|------------------|-----------|------|

|                                 |             | r selected system | ns list that are a | utoinstallable | e using SUSE Mar | nager.      |     |                  |           |      |
|                                 | ,           | ,                 |                    |                | Channel          |             |     |                  |           |      |
| System                          |             |                   |                    | Base           | Channel          |             |     |                  |           |      |
| No systems.                     | vo systems. |                   |                    |                |                  |             |     |                  |           |      |

To schedule autoinstallations for these systems, select a distribution. The autoinstallation profile used for each system in the set is determined via the Autoinstallable Type radio buttons.

Choose Select autoinstallation profile to apply the same profile to all systems in the set. This is the default option. You will see a list of available profiles to select from when you click Continue.

Choose Autoinstall by IP Address to apply different autoinstallation profiles to different systems in the set, by IP address. To do so, at least two autoinstallation profiles must be configured with associated IP ranges.

If you use Autoinstall by IP Address, Uyuni will automatically pick a profile for each system so that the system's IP address will be in one of the IP ranges specified in the profile itself. If such a profile cannot be found, Uyuni will look for an organization default profile and apply that instead. If no matching IP ranges nor organization default profiles can be found, no autoinstallation will be performed on the system. You will be notified on the next page if that happens.

To use Cobbler system records for autoinstallation, select Create PXE Installation Configuration. With PXE boot, you cannot only reinstall clients, but automatically install machines that do not have an operating system installed yet. Uyuni and its network must be properly configured to enable boot using PXE. For more information on Cobbler and {kickstart} templates, refer to Book "Advanced Topics", Chapter 10 "Cobbler".

# 🔊 Note

If a system set contains bare-metal systems and installed clients, only features working for systems without an operating system installed will be available. Full features will be enabled again when all bare-metal systems are removed from the set.

If any of the systems connect to Uyuni via a proxy server, choose either the <u>Preserve Exist-</u> <u>ing Configuration</u> radio button or the <u>Use Proxy</u> radio button. If you choose to autoinstall through a proxy server, select from the available proxies listed in the drop-down box beside the <u>Use Proxy</u> radio button. All of the selected systems will autoinstall via the selected proxy. Click the *Schedule Autoinstall* button to confirm your selections. When the autoinstallations for the selected systems are successfully scheduled, you will return to the System Set Manager page.

#### 7.5.8.2 System Set Manager > Provisioning > Tag Systems

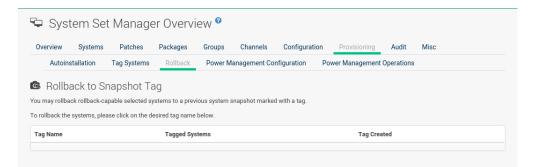

Use this subtab to add meaningful descriptions to the most recent snapshots of your selected systems.

| verview     | Systems        | Patches     | Packages        | Groups        | Channels        | Configuratio      | n Provisioning   | Audit      | Misc |

| Change Power Manage               | ement Configuration 🛛  |
|                                   | details to the systems displayed below. Leave a field blank to avoid changing the corresponding parameter.   |
|                                   |  |
| stem                              |  |
| o systems.                        |  |
|                                   | Don't change   |
| Туре                              | NOTE: IPMI is the only power management type that has been tested and is   |
|                                   | supported, but others may work. To enable other power management types override  |
|                                   | the "java.power_management.types" option in rhn.conf.  |
| Network address                   |  |
|                                   | The hostname or IP address of the power management server.   |
|                                   |  |
| Username                          |  |
|                                   | The username used to log in to the power management server.  |
|                                   |  |
| Password                          |  |
|                                   | The password used to log in to the power management server.  |
| System identifier                 |  |
| o jotom haonantoi                 | The identifier used to specify this system on the power management server. Optional  |
|                                   | because not all power managment types will need this field. This field can also be   |
|                                   | used to pass additional options to the "fence agent". For example, if you are using an<br>IPMI server that requires the Lanplus protocol (and this system's identifier was |
|                                   | "System") then you can set a System Identifier of "-P System" to instruct  |
|                                   | fence_ipmilan to use the Lanplus protocol for this system. See the fence agent's<br>documentation for additional options.  |
|                                   |  |
| UDITY WARNING, Information actual | on this page is available to anyone on the network. See cobbler documentation for more information and mitigation strategies.  |

#### 7.5.8.6 System Set Manager > Provisioning > Power Management Operation

# 7.5.9 System Set Manager > Audit

System sets can be scheduled for XCCDF scans; XCCDF stands for "The Extensible Configuration Checklist Description Format".

|                  |            | Schedule   |                 |  |               |                   |       |      |
| Targeted Systems | 3          |            |                 |  |               |                   |       |      |
| System           |            | OpenSCAF   | Scan Capability |  |               |                   |       |      |
| No systems.      |            |            |                 |  |               |                   |       |      |
|                  |            |            |                 |  |               |                   |       |      |

Enter the command and command line arguments, and the path to the XCCDF document. Then schedule the scan. All target systems are listed below with a flag whether they support OpenSCAP scans. For more details on OpenSCAP and audits, refer to *Chapter 13, Audit*.

#### 7.5.10 System Set Manager > Misc

On the <u>Misc</u> page, you can modify <u>Custom System Information</u>. Click <u>Set a custom value</u> <u>for selected systems</u>, then the name of a key. Enter values for all selected systems, then click the <u>Set Values</u> button. To remove values for all selected systems, click <u>Remove a custom value</u> <u>from selected systems</u>, then the name of the key. Click the <u>Remove Values</u> button to delete. Set System Preferences via the respective radio buttons.

#### 7.5.10.1 System Set Manager > Misc > Hardware

Click the Hardware subtab to schedule a hardware profile refresh. Click Confirm Refresh.

#### 7.5.10.2 System Set Manager > Misc > Software

Click the <u>Software</u> subtab, then the *Confirm Refresh* button to schedule a package profile update of the selected systems.

|                   |                          |                |        |           |          |                    |       |               |

#### 7.5.10.6 System Set Manager > Misc > Reboot

Select the appropriate systems, then click the <u>Reboot Systems</u> link to select these systems for reboot.

To cancel a reboot action, see Section 16.1, "Pending Actions".

# 7.6 Bootstrapping [Salt]

The Bootstrapp Minions page allows you to bootstrap Salt minions from the Web UI.

| Bootstrap Minions 🤅                       |  |
|---|--|
| You can add systems to be managed by prov | iding SSH credentials only. SUSE Manager will prepare the system remotely and will perform the registration. |
| Host:                                     | e.g., host.domain.com  |
| SSH Port:                                 | 22   |
| User:                                     | root   |
| Password:                                 | e.g.,  |
| Activation Key:                           | None   |
| Proxy:                                    | None   |
|   | Disable SSH strict host key checking during bootstrap process  |
|   | Manage system completely via SSH (will not install an agent)   |
|   | + Bootstrap  |

#### FIGURE 7.3: BOOTSTRAPPING

#### **BOOTSTRAPPING PARAMETERS**

#### Host

Place the FQDN of the minion to be bootstrapped within this field.

#### SSH Port

Place the SSH port that will be used to connect and bootstrap a machine. The default is 22.

#### User

Input the minions user login. The default is root.

#### Password

Input the minions login password.

#### **Activation Key**

Select the activation key (associated with a software source channel) that the minion should use to bootstrap with.

#### **Disable SSH Strict Key Host Checking**

This check box is selected by default. This allows the script to auto-accept host keys without requiring a user to manually authenticate.

#### Manage System Completely via SSH (Will not Install an Agent)

Solution Note: Technology Preview

This feature is a Technology preview.

If selected a system will automatically be configured to use SSH. No other connection method will be configured.

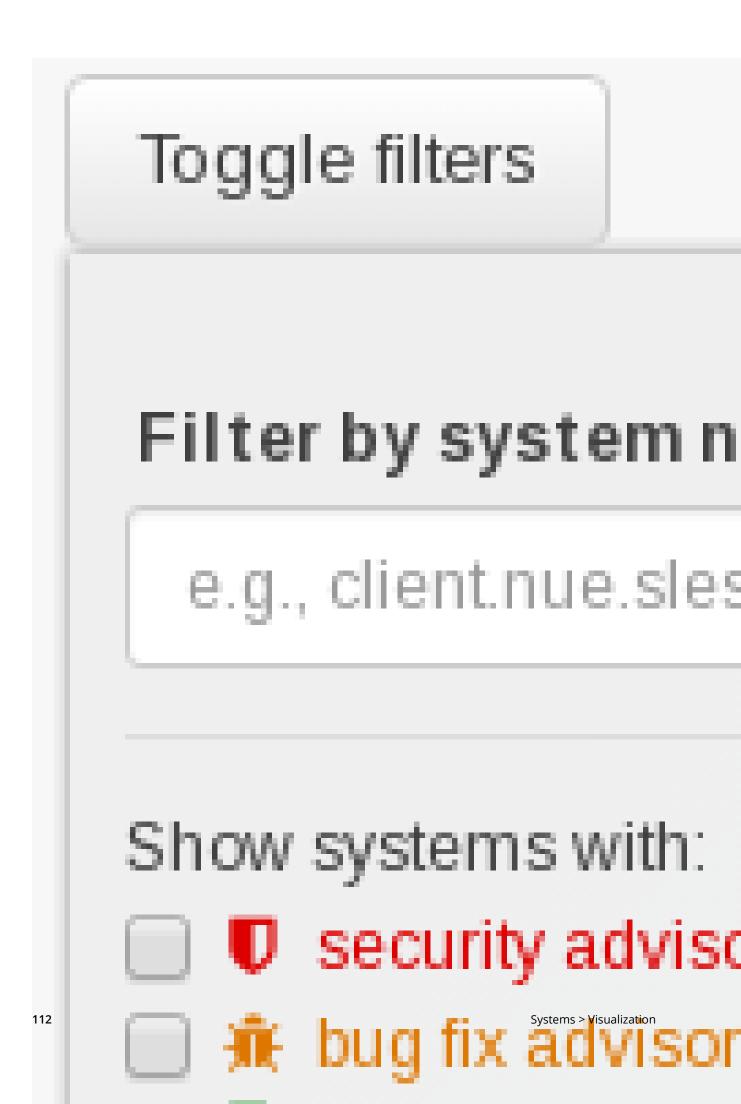

Once your minion's connection details have been filled in click the *Bootstrap* button. When the minion has completed the bootstrap process, find your new minion listed on the *Systems* > *Overview* page.

# 7.7 Systems > Visualization

You can visualize your virtualized, proxy, and systems group topologies. Listed under *Systems* > *Visualization* you will find the <u>Virtualization Hierarchy</u>, <u>Proxy Hierarchy</u>, and <u>Systems Grouping</u> subpages. This features allows you to search, filter, and partition systems by name, base channel, check-in date, group, etc.

To visualize your systems select Main Menu > Systems > Visualization.

Click the *Show Filters* button in the upper right corner to open the filters panel. On the <u>Fil-</u><u>tering</u> tab, systems are filterable by name, base channel, installed products, or with special properties such as security, bug fix, and product enhancement advisories, etc.

On the <u>Partitioning</u> tab, systems may also be partitioned by check-in time. Select the checkin date and time and click the *Apply* button. The *Clear* button will revert current partition configuration.

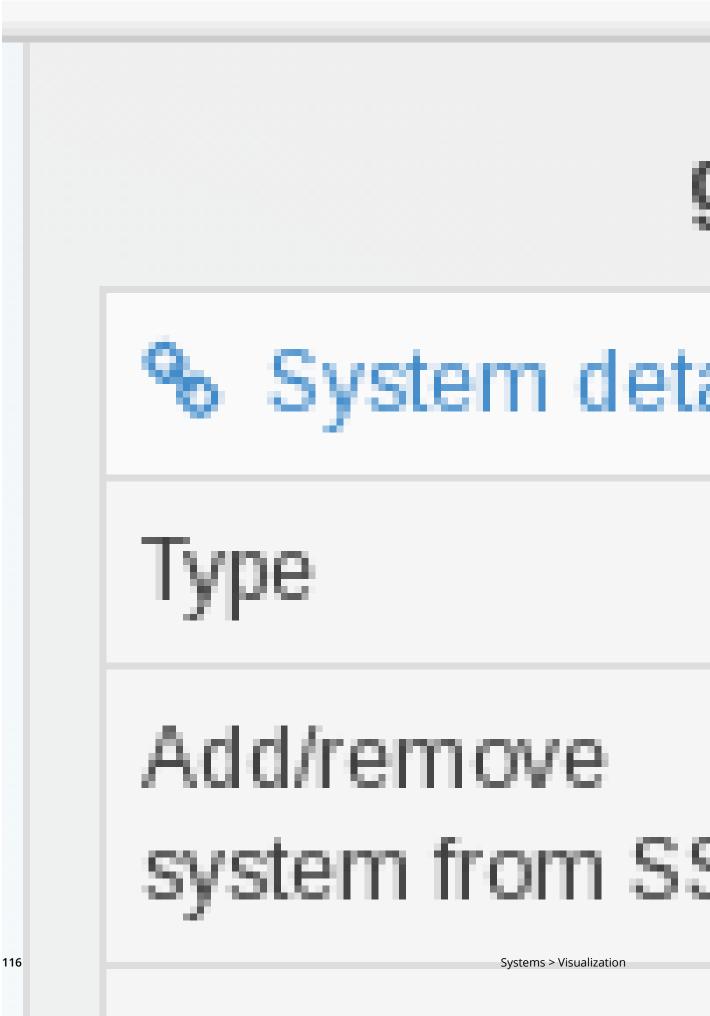

# Partition systems time:

# 2017-05-09

Systems > Visualization

All elements of the network tree are selectable. Clicking any element in the tree opens a box containing information about the selected systems and will be displayed in the top-right of the visualization area.

the second second second second second

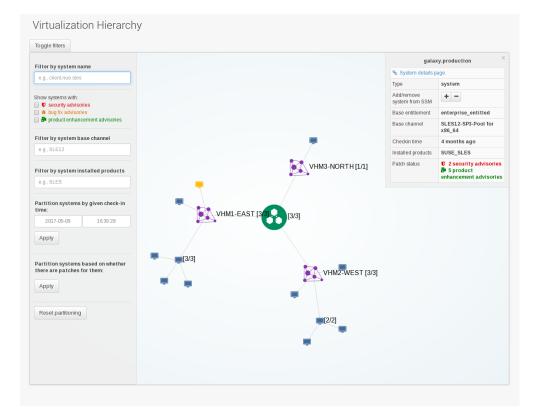

Π.

Systems shown in the visualization view may be added to System Set Manager (SSM) for futher management. This can be performed in two ways:

- Select single systems and click the *Add system to SSM* button in the top-right detail box.
- Add all visible child elements of any parent node in the view (visible means when filters have been applied) by clicking the *Add Children to SSM* button at the bottom of the selection details panel.

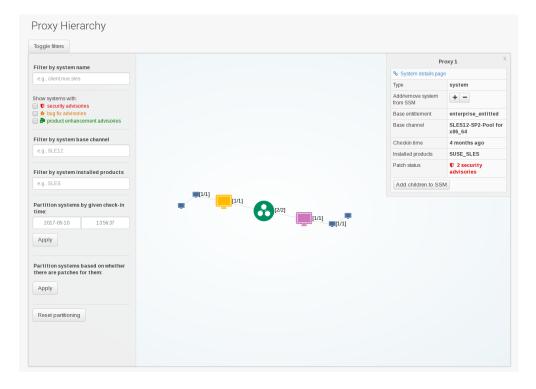

# 7.7.1 Virtualization Hierarchy

The following is an example graphical representation tree of the virtual network hierarchy of virtual systems registered with Uyuni.

# 7.7.2 Proxy Hierarchy

The following is an example graphical representation tree of the proxy network hierarchy of proxy systems and their clients registered with Uyuni.

# 7.7.3 Systems Grouping

The following is a graphical representation tree of the all systems registered with Uyuni.

Systems are grouped according to preconfigured systems groups, and they may also be grouped into various group compositions by using the multi-select box.

| Systems Grouping  |                    |        |                |
|---|--------------------|--------|----------------|
| Toggle filters  |                    |        |                |
| Filter by system name   |                    | Pro    | oxy Systems X  |
| e.g., dientnue.sles   |                    | Туре   | group          |
|   |                    | Groups | Proxy Systems  |
| Show systems with:    Security advisories   Kug fix advisories    Security advisories |                    | Add cl | hildren to SSM |
| Filter by system base channel   |                    |        |                |
| e.g., SLE12   |                    |        |                |
| Filter by system installed<br>products  |                    |        |                |
| e.g., SLES  | salt systems [4/4] |        |                |
|   |                    |        |                |
| Split into groups Add a grouping level  | [1/1]              |        |                |
| Proxy Systems<br>Traditional Systems  | -                  |        |                |
| salt systems<br>< <no group="">&gt;</no>  |                    |        |                |
| Remove this level   |                    |        |                |
| Partition systems by given check-<br>in time:   |                    |        |                |
| 2017-05-10 14:11:15   |                    |        |                |
| Apply   |                    |        |                |
| Partition systems based on whether there are patches for them:                        |                    |        |                |
| Apply   |                    |        |                |

# 7.8 Systems > Advanced Search

Carry out an <u>Advanced Search</u> on your systems according to the following criteria: network info, hardware devices, location, activity, packages, details, DMI info, and hardware.

| <b>Q</b> Advanced Search   | )  |  |
|--|--|--|
| Advanced Search will return results from all systems to which you have administrative access.<br>Specify your search criteria below. |  |  |
| Search For:  |  |  |
| Field to Search:   | Name/Description                                 |  |
| Where to Search:   | Search all systems     Search system set manager |  |
| Invert Result  | Invert search results                            |  |
| Fine Grained Search:   | Fine grained search results                      |  |
|  | Q Search   |  |

Refine searches using the Field to Search drop-down box, which is set to Name/Description by default.

The Activity selections (<u>Days Since Last Check-in</u>, for example) are useful in finding and removing outdated system profiles.

Type the keyword, select the criterion to search by, use the radio buttons to specify whether you want to query all systems or only those in the <u>System Set Manager</u>, and click the *Search* button. To list all systems that do *not* match the criteria, select the <u>Invert Result</u> check box. The results appear at the bottom of the page. For details on how to use the resulting system list, refer to *Chapter 7, Systems*.

# 7.9 Systems > Activation Keys

Users with the Activation Key Administrator role (including Uyuni Administrators) can generate activation keys in the Uyuni Web UI. With such an activation key, register a SUSE Linux Enterprise or Red Hat Enterprise Linux system, entitle the system to a Uyuni service level and subscribe the system to specific channels and system groups through the <u>rhnreg\_ks</u> command line utility.

# Note

System-specific activation keys created through the <u>Reactivation</u> subtab of the <u>System</u> Details page are not part of this list because they are not reusable across systems.

For more information about Activation Keys, see *Book "Best Practices", Chapter 7 "Activation Key Management"*.

# 7.9.1 Managing Activation Keys

From the Activation Key page organize activation keys for channel management.

|           | leys are used to registe                              | er systems. Systems registered with an activation key will | inherit the characteristics defined by that key.  |
|-----------|---|--|---|
| Univers   | al Default  |  |   |
|           | rsal default activation<br>explicitly specify that ke |  | to your organization will inherit the properties of that key by default without the                             |
|           | o not currently have a u<br>rsal Default?' checkboy   |  | iversal default, please visit the details page of that key and check off the $\begin{tabular}{c} \end{tabular}$ |
|           | ion Keys<br>ng activation keys have                   | been created for use by your organization.                 |   |
| Select    | All Unselect All                                      | 1 - 1 of 1 (1 selected)                                    | Update Activation K   |
| Filter by | Description:  | Select first character +                                   |   |
|           | Description   | Key  | Usage   |
| nabled?   |   | 1-DEFAULT  | 4/(unlimited)   |
| nabled?   | None  |  |   |
| Enabled?  |   | 1-DEFAULT  | 4/(unlimited)   |

#### To create an activation key:

#### PROCEDURE: CREATING ACTIVATION KEYS

- 1. Select Main Menu > Systems > Activation Keys from the left bar.
- 2. Click the Create Key link at the upper right corner.
- 3. Description Enter a Description to identify the generated activation key.
- 4. <u>Key</u> Either choose automatic generation by leaving this field blank or enter the key you want to generate in the <u>Key</u> field. This string of characters can then be used with <u>rhn-reg\_ks</u> to register client systems with Uyuni. Refer to *Section 7.9.2, "Using Multiple Activation Keys at Once"* for details.

# Warning: Allowed Characters

Do not insert commas or double quotes in the key. All other characters are allowed, but  $\leq$  (){} (this includes the space) will get removed automatically. If the string is empty, a random one is generated.

Commas are problematic because they are used as separator when two or more activation keys are used at once.

- 5. <u>Usage</u> The maximum number systems that can be registered with the activation key concurrently. Leave blank for unlimited use. Deleting a system profile reduces the usage count by one and registering a system profile with the key increases the usage count by one.
- 6. <u>Base Channels</u> The primary channel for the key. This can be either the <u>Uyuni Default</u> channel, a SUSE provided channel, or a custom base channel. Selecting <u>Uyuni Default</u> allows client systems to register with the SUSE-provided default channel that corresponds with their installed version of SUSE Linux Enterprise. You can also associate the key with a custom base channel. If a system using this key is not compatible with the selected channel, it will fall back to the Uyuni default channel.
- <u>Child Channels</u> When the base channel is selected the list of available child channels will get fetched and display in real time below the base channel. Select the child channels you need (for example, the Tools child channel).
- 8. <u>Add-on System Types</u> The supplemental system types for the key, for example, Virtualization Host. All systems will receive these system types with the key.
- 9. <u>Contact Method</u> Select how clients communicate with Uyuni. <u>Default</u> (Pull) waits for the client to check in. With <u>Push via SSH</u> and <u>Push via SSH tunnel</u> the server contacts the client via SSH (with or without tunnel) and pushes updates and actions, etc. For more information about contact methods, see *Book "Best Practices", Chapter 8 "Contact Methods"*.
- 10. Universal Default Select whether this key should be considered the primary activation key for your organization.
  - Warning: Changing the Default Activation Key Only one universal default activation key can be defined per organization. If a universal key already exists for this organization, you will unset the currently used universal key by activating the check box.
- 11. Click Create Activation Key.

To create more activation keys, repeat the steps above.

After creating the unique key, it appears in the list of activation keys along with the number of times it has been used. Only Activation Key Administrators can see this list. At this point, you can configure the key further. For example, associate the key with packages (for example, the rhncfg-actions package) and groups. Systems registered with the key get automatically subscribed to them.

To change the settings of a key, click the key's description in the list to display its <u>Details</u> page. Via additional tabs you can select packages, configuration channels, group membership, and view activated systems. Modify the appropriate tab then click the *Update Activation Key* button. To disassociate groups from a key, deselect them in the respective menus by <u>Ctrl</u>-clicking their highlighted names. To remove a key entirely, click the <u>Delete Key</u> link in the upper right corner of the Details page. In the upper right corner find also the Clone Key link.

| 🔦 None º  |  | 省 Clone Key   🗃 Delete Key |  |  |
|---|--|----------------------------|--|--|
| Details Child Channels Packa  | ges Configuration Groups Activated Systems   |                            |  |  |
| Activation Key Details<br>Systems registered with this activation key will inherit the settings listed below. |  |                            |  |  |
| Description:  | None   |                            |  |  |
|   |  |                            |  |  |
| Key:  | 1- DEFAULT   |                            |  |  |
|   | Activation key can contains only numbers [0-9], letters [a-z A-Z], $\dot{\gamma}_{\rm c}$ and $\dot{\gamma}$   |                            |  |  |
|   | Leave blank for automatic key generation. Note that the prefix is an indication of the SUSE Manager organization the key is associated with.   |                            |  |  |
| Usage:  |  |                            |  |  |
|   | Leave blank for unlimited use.   |                            |  |  |
| Base Channel: testchannel   |  |                            |  |  |
|   | Choose "SUSE Manager Default" to allow systems to register to the default SUSE<br>Manager provided channel that corresponds to the installed SUSE Linux version.<br>Instead of the default, you may choose a particular SUSE provided channel or a<br>custom base channel, but if a system using this key is not compatible with the<br>selected channel, it will fall back to its SUSE Manager Default channel. |                            |  |  |
| Add-On System Types:  | s: Container Build Host  |                            |  |  |
| Configuration File Deployment:  | Depley configuration files to systems an registration  |                            |  |  |
| Comguration File Deployment.  | nt: Deploy configuration files to systems on registration<br>Tip: If the system is registered via Salt, the highstate will be executed on registration<br>if this checkbox is selected.  |                            |  |  |
| Contact Method:   | Default  |                            |  |  |
| Universal Default:  |  |                            |  |  |
|   | Tip: Only one universal default activation key may be set for this organization. By setting this key as universal default, you will remove universal default status from the current universal default key if it exists. If this key is set as universal default, then newly-registered systems to your organization will inherit the properties of this key.  |                            |  |  |

Any (client tools) package installation requires that the Client Tools channel is available and the <u>Provisioning</u> check box is selected. The Client Tools channel should be selected in the <u>Child</u> Channels listing below the selected base channel.

After creating the activation key, you can see in the <u>Details</u> tab a check box named <u>Configuration File Deployment</u>. If you select it, all needed packages are automatically added to the <u>Packages</u> list. By default, the following packages are added: rhncfg, rhncfg-client, and rhncfg-actions.

If you select <u>Virtualization Host</u> you automatically get the following package: rhn-virtualization-host.

Adding the osad package makes sense to execute scheduled actions immediately after the schedule time. When the activation key is created, you can add packages with selecting the key (*Main Menu* > *Systems* > *Activation Keys*), then on the activation key details page, go for the Packages tab and add osad.

To disable system activations with a key, uncheck the corresponding box in the Enabled column in the key list. The key can be re-enabled by selecting the check box. Click the *Update Activation Keys* button on the bottom right-hand corner of the page to apply your changes.

# 7.9.2 Using Multiple Activation Keys at Once

Multiple activation keys can be specified at the command line or in a single autoinstallation profile. This allows you to aggregate the aspects of various keys without re-creating a specific key for every system that you want to register, simplifying the registration and autoinstallation processes while slowing the growth of your key list. Separate keys with a comma at the command line with <u>rhnreg\_ks</u> or in a {kickstart} profile in the <u>Activation Keys</u> tab of the <u>Autoinstallation Details</u> page.

Registering with multiple activation keys requires some caution. Conflicts between some values cause registration to fail. Conflicts in the following values do not cause registration to fail, a combination of values is applied: software packages, software child channels, and configuration channels. Conflicts in the remaining properties are resolved in the following manner:

- Base software channels: registration fails.
- System types: registration fails.
- Enable configuration flag: configuration management is set.

Do not use system-specific activation keys along with other activation keys; registration fails in this event.

You are now ready to use multiple activation keys at once.

# 7.10 Systems > Stored Profiles

Uyuni Provisioning customers can create package profiles via the System Details page.

| 😻 Stored Profiles <sup>0</sup>   |              |         |  |
|--|--------------|---------|--|
| The following stored profiles exist within your organization. To create a stored profile from a system, go to the Packages view for that system. |              |         |  |
| Name   | Base Channel | Created |  |
| No stored profiles.  |              |         |  |
|  |              |         |  |

Under System Details > Software > Packages > Profiles, click Create System Profile. Enter a Profile Name and Profile Description, then click Create Profile. These profiles are displayed on the Stored Profiles page (left navigation bar), where they can be edited or deleted.

To edit a profile, click its name in the list, alter its name or description, and click the *Update* button. To view software associated with the profile, click the <u>Packages</u> subtab. To remove the profile entirely, click Delete Profile at the upper-right corner of the page.

# 7.11 Systems > Custom System Info

Uyuni customers may include completely customizable information about their systems.

| 🔍 Custom   | System Info Keys | Ø                  | + Create Key   |
|--|------------------|--------------------|----------------|
| Custom system info keys allow your adminstrators to store relevant custom key/value pairs with your system profiles. Custom system info values are fully searchable.<br>The following custom system info keys have been defined for your organization. |                  |                    |                |
| Key Label  | Description      | Systems With Value | Last Modified  |
| No Custom Info Keys  | Found            |                    |                |
|  |                  |                    | 🖺 Download CSV |

Unlike with notes, the information here is more formal and can be searched. for example, you may decide to specify an asset tag for each system. To do so, select <u>Custom System Info</u> from the left navigation bar and create an asset key.

Click <u>Create Key</u> in the upper-right corner of the page. Enter a suitable label and description, such as <u>Asset</u> and <u>Precise location of each system</u>, then click *Create Key*. The key will show up in the custom info keys list.

When the key exists, you may assign a value to it through the <u>Custom Info</u> tab of the <u>System</u> Details page. Refer to Section 7.3.1.8, "System Details > Details > Custom Info" for instructions.

#### Autoinstallation 8

# Solution Note: Autoinstallation Types: AutoYaST and **Kickstart**

In the following section, AutoYaST and AutoYaST features apply for SUSE Linux Enterprise client systems only. For RHEL systems, use Kickstart and Kickstart features.

AutoYaST and Kickstart configuration files allow administrators to create an environment for automating otherwise time-consuming system installations, such as multiple servers or workstations. AutoYaST files have to be uploaded to be managed with Uyuni. Kickstart files can be created, modified, and managed within the Uyuni Web interface.

Uyuni also features the Cobbler installation server. For more information on Cobbler, see Book "Advanced Topics", Chapter 10 "Cobbler".

Uyuni provides an interface for developing Kickstart and AutoYaST profiles that can be used to install Red Hat Enterprise Linux or SUSE Linux Enterprise on either new or already-registered systems automatically according to certain specifications.

# Autoinstallation O\

# Autoinstallation Summary

No autoinstallation profiles available

# Systems Currently Autoin:

# Autoinstalling Systems

FIGURE 8.1: AUTOINSTALLATION OVERVIEW

There are no systems currently autoinstal

This overview page displays the status of automated installations (Kickstart and AutoYaST) on your client systems: the types and number of profiles you have created and the progress of systems that are scheduled to be installed using Kickstart or AutoYaST. In the upper right area is the *Autoinstallation Actions* section, which contains a series of links to management actions for your Kickstart or AutoYaST profiles. Before explaining the various automated installation options on this page, the next two sections provide an introduction to AutoYaST (*Section 8.1, "Introduction to AutoYaST"*) and Kickstart (*Section 8.2, "Introduction to Kickstart"*).

# 8.1 Introduction to AutoYaST

Using AutoYaST, a system administrator can create a single file containing the answers to all the questions that would normally be asked during a typical installation of a SUSE Linux Enterprise system.

AutoYaST files can be kept on a single server system and read by individual computers during the installation. This way the same AutoYaST file is used to install SUSE Linux Enterprise on multiple machines.

The *SUSE Linux Enterprise Server AutoYaST Guide* at (https://www.suse.com/documentation/sles-15/ a) will contain an in-depth discussion of "Automated Installation" using AutoYaST.

# 8.1.1 AutoYaST Explained

When a machine is to receive a network-based AutoYaST installation, the following events must occur in this order:

- 1. After being connected to the network and turned on, the machine's PXE logic broadcasts its MAC address and requests to be discovered.
- 2. If no static IP address is used, the DHCP server recognizes the discovery request and offers network information needed for the new machine to boot. This includes an IP address, the default gateway to be used, the netmask of the network, the IP address of the TFTP or HTTP server holding the bootloader program, and the full path and file name to that program (relative to the server's root).
- 3. The machine applies the networking information and initiates a session with the server to request the bootloader program.

4. The bootloader searches for its configuration file on the server from which it was loaded. This file dictates which Kernel and Kernel options, such as the initial RAM disk (initrd) image, should be executed on the booting machine. Assuming the bootloader program is SYSLINUX, this file is located in the <u>pxelinux.cfg</u> directory on the server and named the hexadecimal equivalent of the new machine's IP address. For example, a bootloader configuration file for SUSE Linux Enterprise Server should contain:

```
port 0
prompt 0
timeout 1
default autoyast
label autoyast
kernel vmlinuz
append autoyast=http://`my_susemanager_server`/`path`\
    install=http://`my_susemanager_server`/`repo_tree`
```

- 5. The machine accepts and uncompresses the initrd and kernel, boots the kernel, fetches the instsys from the install server and initiates the AutoYaST installation with the options supplied in the bootloader configuration file, including the server containing the AutoYaST configuration file.
- 6. The new machine is installed based on the parameters established within the AutoYaST configuration file.

# 8.1.2 AutoYaST Prerequisites

Some preparation is required for your infrastructure to handle AutoYaST installations. For instance, before creating AutoYaST profiles, you may consider:

- A DHCP server is not required for AutoYaST, but it can make things easier. If you are using static IP addresses, you should select static IP while developing your AutoYaST profile.
- Host the AutoYaST distribution trees via HTTP, properly provided by Uyuni.
- If conducting a so-called bare-metal AutoYaST installation, provide the following settings:
  - Configure DHCP to assign the required networking parameters and the bootloader program location.
  - In the bootloader configuration file, specify the kernel and appropriate kernel options to be used.

# 8.1.3 Building Bootable AutoYaST ISOs

While you can schedule a registered system to be installed by AutoYaST with a new operating system and package profile, you can also automatically install a system that is not registered with Uyuni, or does not yet have an operating system installed. One common method of doing this is to create a bootable CD-ROM that is inserted into the target system. When the system is rebooted or switched on, it boots from the CD-ROM, loads the AutoYaST configuration from your Uyuni, and proceeds to install SUSE Linux Enterprise Server according to the AutoYaST profile you have created.

To use the CD-ROM, boot the system and type <u>autoyast</u> at the prompt (assuming you left the label for the AutoYaST boot as <u>autoyast</u>). When you press <u>Enter</u>, the AutoYaST installation begins.

For more information about image creation, refer to KIWI at http://doc.opensuse.org/projects/ kiwi/doc/ 2.

### 8.1.4 Integrating AutoYaST with PXE

In addition to CD-ROM-based installations, AutoYaST installation through a Pre-Boot Execution Environment (PXE) is supported. This is less error-prone than CDs, enables AutoYaST installation from bare metal, and integrates with existing PXE/DHCP environments.

To use this method, make sure your systems have network interface cards (NIC) that support PXE, install and configure a PXE server, ensure DHCP is running, and place the installation repository on an HTTP server for deployment. Finally upload the AutoYaST profile via the Web interface to the Uyuni server. Once the AutoYaST profile has been created, use the URL from the *Autoinstallation Overview* page, as for CD-ROM-based installations.

To obtain specific instructions for conducting PXE AutoYaST installation, refer to the Using PXE Boot section of the SUSE Linux Enterprise Deployment Guide.

Starting with Section 8.3, "Autoinstallation > Profiles (Kickstart and AutoYaST)", AutoYaST options available from Systems > Kickstart are described.

# 8.2 Introduction to Kickstart

Using Kickstart, a system administrator can create a single file containing the answers to all the questions that would normally be asked during a typical installation of Red Hat Enterprise Linux.

Kickstart files can be kept on a single server and read by individual computers during the installation. This method allows you to use one Kickstart file to install Red Hat Enterprise Linux on multiple machines.

The *Red Hat Enterprise Linux System Administration Guide* contains an in-depth description of Kickstart (https://access.redhat.com/documentation/en/red-hat-enterprise-linux/ **?**).

# 8.2.1 Kickstart Explained

When a machine is to receive a network-based {kickstart}, the following events must occur in this order:

- 1. After being connected to the network and turned on, the machine's PXE logic broadcasts its MAC address and requests to be discovered.
- 2. If no static IP address is used, the DHCP server recognizes the discovery request and offers network information needed for the new machine to boot. This information includes an IP address, the default gateway to be used, the netmask of the network, the IP address of the TFTP or HTTP server holding the bootloader program, and the full path and file name of that program (relative to the server's root).
- 3. The machine applies the networking information and initiates a session with the server to request the bootloader program.
- 4. The bootloader searches for its configuration file on the server from which it was loaded. This file dictates which kernel and kernel options, such as the initial RAM disk (initrd) image, should be executed on the booting machine. Assuming the bootloader program is SYSLINUX, this file is located in the <u>pxelinux.cfg</u> directory on the server and named the hexadecimal equivalent of the new machine's IP address. For example, a bootloader configuration file for Red Hat Enterprise Linux AS 2.1 should contain:

```
port 0
prompt 0
timeout 1
default My_Label
label My_Label
    kernel vmlinuz
    append ks=http://`my_susemanager_server`/`path`\
        initrd=initrd.img network apic
```

- 5. The machine accepts and uncompresses the init image and kernel, boots the kernel, and initiates a Kickstart installation with the options supplied in the bootloader configuration file, including the server containing the Kickstart configuration file.
- 6. This {kickstart} configuration file in turn directs the machine to the location of the installation files.
- 7. The new machine is built based on the parameters established within the Kickstart configuration file.

### 8.2.2 Kickstart Prerequisites

Some preparation is required for your infrastructure to handle {kickstart}s. For instance, before creating Kickstart profiles, you may consider:

- A DHCP server is not required for kickstarting, but it can make things easier. If you are using static IP addresses, select static IP while developing your Kickstart profile.
- An FTP server can be used instead of hosting the Kickstart distribution trees via HTTP.
- If conducting a bare metal {kickstart}, you should configure DHCP to assign required networking parameters and the bootloader program location. Also, specify within the bootloader configuration file the kernel to be used and appropriate kernel options.

# 8.2.3 Building Bootable Kickstart ISOs

While you can schedule a registered system to be kickstarted to a new operating system and package profile, you can also {kickstart} a system that is not registered with Uyuni or does not yet have an operating system installed. One common method of doing this is to create a bootable CD-ROM that is inserted into the target system. When the system is rebooted, it boots from the CD-ROM, loads the {kickstart} configuration from your Uyuni, and proceeds to install Red Hat Enterprise Linux according to the Kickstart profile you have created.

To do this, copy the contents of <u>/isolinux</u> from the first CD-ROM of the target distribution. Then edit the <u>isolinux.cfg</u> file to default to 'ks'. Change the 'ks' section to the following template:

label ks kernel vmlinuz

```
append text ks=`url`initrd=initrd.img lang= devfs=nomount \
  ramdisk_size=16438`ksdevice`
```

IP address-based {kickstart} URLs will look like this:

http://`my.manager.server`/kickstart/ks/mode/ip\_range

The {kickstart} distribution defined via the IP range should match the distribution from which you are building, or errors will occur. ksdevice is optional, but looks like:

ksdevice=eth0

It is possible to change the distribution for a Kickstart profile within a family, such as Red Hat Enterprise Linux AS 4 to Red Hat Enterprise Linux ES 4, by specifying the new distribution label. Note that you cannot move between versions (4 to 5) or between updates (U1 to U2).

Next, customize <u>isolinux.cfg</u> further for your needs by adding multiple Kickstart options, different boot messages, shorter timeout periods, etc.

Next, create the ISO as described in the *Making an Installation Boot CD-ROM* section of the *Red Hat Enterprise Linux Installation Guide*. Alternatively, issue the command:

```
mkisofs -o file.iso -b isolinux.bin -c boot.cat -no-emul-boot \
    -boot-load-size 4 -boot-info-table -R -J -v -T isolinux/
```

Note that <u>isolinux/</u> is the relative path to the directory containing the modified isolinux files copied from the distribution CD, while <u>file.iso</u> is the output ISO file, which is placed into the current directory.

Burn the ISO to CD-ROM and insert the disc. Boot the system and type "ks" at the prompt (assuming you left the label for the Kickstart boot as 'ks'). When you press *Enter*, Kickstart starts running.

#### 8.2.4 Integrating Kickstart with PXE

In addition to CD-ROM-based installs, Kickstart supports a Pre-Boot Execution Environment (PXE). This is less error-prone than CDs, enables kickstarting from bare metal, and integrates with existing PXE/DHCP environments.

To use this method, make sure your systems have network interface cards (NIC) that support PXE. Install and configure a PXE server and ensure DHCP is running. Then place the appropriate files on an HTTP server for deployment. Once the {kickstart} profile has been created, use the URL from the *Kickstart Details* page, as for CD-ROM-based installs.

To obtain specific instructions for conducting PXE {kickstart}s, refer to the PXE Network Installations chapter of the Red Hat Enterprise Linux 4 System Administration Guide.

# 🕥 Note

Running the Network Booting Tool, as described in the Red Hat Enterprise Linux 4: System Administration Guide, select "HTTP" as the protocol and include the domain name of the Uyuni in the Server field if you intend to use it to distribute the installation files.

The following sections describe the autoinstallation options available from the Systems > Autoinstallation page.

# 8.3 Autoinstallation > Profiles (Kickstart and AutoYaST)

This page lists all profiles for your organization, shows whether these profiles are active, and specifies the distribution tree with which each profile is associated.

# Autoinstallation O

# Autoinstallation Summary

No autoinstallation profiles available

# Systems Currently Autoin:

# Autoinstalling Systems

There are no systems currently autoinstal

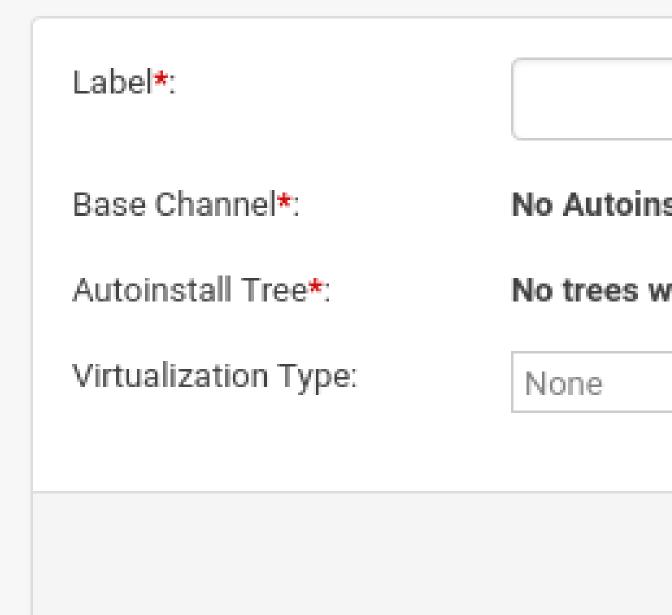

You can either create a Kickstart profile by clicking the <u>Create Kickstart Profile</u> link, upload or paste the contents of a new profile clicking the <u>Upload Kickstart/Autoyast File</u>, or edit an existing Kickstart profile by clicking the name of the profile. Note, you can only update AutoYaST profiles using the upload button. You can also view AutoYaST profiles in the edit box or change the virtualization type using the selection list.

#### 8.3.1 Create a Kickstart Profile

Click on the <u>Create Kickstart Profile</u> link from the *Main Menu* > *Systems* > *Autoinstallation* page to start the wizard that populates the base values needed for a Kickstart profile.

# 🖌 Step 1: Create Kick

A kickstart file is a simple text file containing Enterprise Linux. A kickstart profile includes installation files.

- 1. On the first line, enter a Kickstart profile label. This label cannot contain spaces, so use dashes (-) or underscores  $(\setminus)$  as separators.
- 2. Select a Base Channel for this profile, which consists of packages based on a specific architecture and Red Hat Enterprise Linux release.

# Note: Creating Base Channel

Base channels are only available if a suitable distribution is created first. For creating distributions, see Section 8.6, "Autoinstallation > Distributions".

- 3. Select an Kickstartable Tree for this profile. The Kickstartable Tree drop-down menu is only populated if one or more distributions have been created for the selected base channel (see Section 8.6, "Autoinstallation > Distributions").
- 4. Instead of selecting a specific tree, you can also check the box Always use the newest Tree for this base channel. This setting lets Uyuni automatically pick the latest tree that is associated with the specified base channels. If you add new trees later, Uyuni will always keep the most recently created or modified.
- 5. Select the Virtualization Type from the drop-down menu.

#### 🔊 Note

If you do not intend to use the Kickstart profile to create virtual guest systems, you can leave the drop-down at the default None choice.

- 6. On the second page, select (or enter) the location of the Kickstart tree.
- 7. On the third page, select a root password for the system.

Depending on your base channel, your newly created Kickstart profile might be subscribed to a channel that is missing required packages. For {kickstart} to work properly, the following packages should be present in its base channel: pyOpenSSL, rhnlib, libxml2-python, and spacewalk-koan and associated packages.

To resolve this issue:

- Make sure that the Tools software channel for the Kickstart profile's base channel is available to your organization. If it is not, you must request entitlements for the Tools software channel from the Uyuni administrator.
- Make sure that the Tools software channel for this Kickstart profile's base channel is available to your Uyuni as a child channel.
- Make sure that <u>rhn-kickstart</u> and associated packages corresponding to this {kickstart} are available in the Tools child channel.

The final stage of the wizard presents the *Autoinstallation Details* > *Details* tab. On this tab and the other subtabs, nearly every option for the new Kickstart profile can be customized.

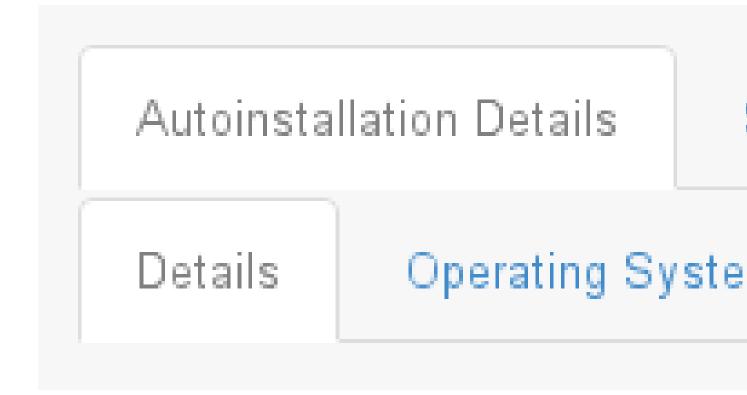

Once created, you can access the Kickstart profile by downloading it from the <u>Autoinstalla-</u> <u>tion Details</u> page by clicking the <u>Autoinstallation File</u> subtab and clicking the <u>Down-</u> <u>load Autoinstallation File</u> link.

If the Kickstart file is not managed by Uyuni, you can access it via the following URL:

```
http://`my.manager.server`/ks/dist/ks-rhel-`ARCH`-`VARIANT`-`VERSION`
```

In the above example, <u>ARCH</u> is the architecture of the Kickstart file, <u>VARIANT</u> is either <u>client</u> or <u>server</u>, and <u>VERSION</u> is the release of Red Hat Enterprise Linux associated with the Kickstart file.

The following sections describe the options available on each subtab.

On the Autoinstallation Details > Details page, you have the following options:

- Change the profile Label.
- Change the operating system by clicking (Change).
- Change the Virtualization Type.

#### Note

Changing the <u>Virtualization Type</u> may require changes to the Kickstart profile bootloader and partition options, potentially overwriting user customizations. Consult the Partitioning tab to verify any new or changed settings.

- Change the amount of <u>Virtual Memory</u> (in Megabytes of RAM) allocated to virtual guests autoinstalled with this profile.
- Change the number of <u>Virtual CPUs</u> for each virtual guest.

- Change the Virtual Storage Path from the default in /var/lib/xen/ .
- Change the amount of Virtual Disk Space (in GB) allotted to each virtual guest.
- Change the Virtual Bridge for networking of the virtual guest.
- Deactivate the profile so that it cannot be used to schedule a {kickstart} by removing the Active check mark.
- Check whether to enable logging for custom <u>%post</u> scripts to the <u>/root/ks-post.log</u> file.
- Decide whether to enable logging for custom %pre scripts to the /root/ks-pre.log file.
- Choose whether to preserve the <u>ks.cfg</u> file and all <u>%include</u> fragments to the <u>/root/</u> directory of all systems autoinstalled with this profile.
- Select whether this profile is the default for all of your organization's {kickstart}s by checking or unchecking the box.
- Add any Kernel Options in the corresponding text box.
- Add any Post Kernel Options in the corresponding text box.
- Enter comments that are useful to you in distinguishing this profile from others.

#### 8.3.1.2 Autoinstallation Details > Operating System

On this page, you can make the following changes to the operating system that the Kickstart profile installs:

#### Change the base channel

Select from the available base channels. Uyuni administrators see a list of all base channels that are currently synced to the Uyuni.

#### **Child Channels**

Subscribe to available child channels of the base channel, such as the Tools channel.

#### Available Trees

Use the drop-down menu to choose from available trees associated with the base channel.

Always use the newest Tree for this base channel.

Instead of selecting a specific tree, you can also check the box *Always use the newest Tree for this base channel.* This setting lets Uyuni automatically pick the latest tree that is associated with the specified base channels. If you add new trees later, Uyuni will always keep the most recently created or modified.

#### Software URL (File Location)

The exact location from which the Kickstart tree is mounted. This value is determined when the profile is created. You can view it on this page but you cannot change it.

#### 8.3.1.3 Autoinstallation Details > Variables

Autoinstallation variables can substitute values in Kickstart and AutoYaST profiles. To define a variable, create a name-value pair (name/value) in the text box.

For example, if you want to autoinstall a system that joins the network of a specified organization (for example the Engineering department), you can create a profile variable to set the IP address and the gateway server address to a variable that any system using that profile will use. Add the following line to the Variables text box.

```
IPADDR=192.168.0.28
GATEWAY=192.168.0.1
```

Now you can use the name of the variable in the profile instead of a specific value. For example, the network part of a Kickstart file looks like the following:

```
network --bootproto=static --device=eth0 --onboot=on --ip=$IPADDR \
    --gateway=$GATEWAY
```

The \$IPADDR will be resolved to 192.168.0.28, and the \$GATEWAY to 192.168.0.1

#### Note

There is a hierarchy when creating and using variables in Kickstart files. System Kickstart variables take precedence over <u>Profile</u> variables, which in turn take precedence over <u>Distribution</u> variables. Understanding this hierarchy can alleviate confusion when using variables in {kickstart}s.

Using variables are just one part of the larger Cobbler infrastructure for creating templates that can be shared between multiple profiles and systems. For more information about Cobbler and templates, refer to *Book "Advanced Topics", Chapter 10 "Cobbler"*.

#### 8.3.1.4 Autoinstallation Details > Advanced Options

From this page, you can toggle several installation options on and off by checking and unchecking the boxes to the left of the option. For most installations, the default options are correct. Refer to Red Hat Enterprise Linux documentation for details.

#### 8.3.1.5 Assigning Default Profiles to an Organization

You can specify an Organization Default Profile by clicking *Autoinstallation* > *Profiles* > *profile name* > *Details*, then checking the <u>Organization Default Profile</u> box and finally clicking Update.

#### 8.3.1.6 Assigning IP Ranges to Profiles

You can associate an IP range to an autoinstallation profile by clicking on *Autoinstallation* > *Pro-files* > *profile name* > *Bare Metal Autoinstallation*, adding an IPv4 range and finally clicking *Add IP Range*.

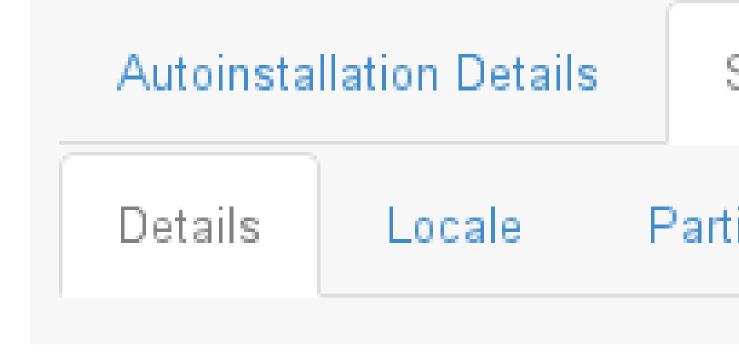

#### 8.3.1.7 Autoinstallation Details > Bare Metal Autoinstallation

This subtab provides the information necessary to Kickstart systems that are not currently registered with Uyuni. Using the on-screen instructions, you may either autoinstall systems using boot media (CD-ROM) or by IP address.

#### 8.3.1.8 System Details > Details

Displays subtabs that are available from the <u>System Details</u> tab. On the *System Details* > *Details* page, you have the following options:

- Select between DHCP and static IP, depending on your network.
- Choose the level of SELinux that is configured on kickstarted systems.
- Enable configuration management or remote command execution on kickstarted systems.
- Change the root password associated with this profile.

#### 8.3.1.9 System Details > Locale

Change the timezone for kickstarted systems.

#### 8.3.1.10 System Details > Partitioning

From this subtab, indicate the partitions that you wish to create during installation. For example:

```
partition /boot --fstype=ext3 --size=200
partition swap --size=2000
partition pv.01 --size=1000 --grow
volgroup myvg pv.01 logvol / --vgname=myvg --name=rootvol --size=1000 --grow
```

#### 8.3.1.11 System Details > File Preservation

If you have previously created a file preservation list, include this list as part of the {kickstart}. This will protect the listed files from being over-written during the installation process. Refer to *Section 8.7, "Autoinstallation > File Preservation"* for information on how to create a file preservation list.

#### 8.3.1.12 System Details > GPG & SSL

From this subtab, select the GPG keys and/or SSL certificates to be exported to the kickstarted system during the %post section of the {kickstart}. For Uyuni customers, this list includes the SSL Certificate used during the installation of Uyuni.

### Note

Any GPG key you wish to export to the kickstarted system must be in ASCII rather than binary format.

#### 8.3.1.13 System Details > Troubleshooting

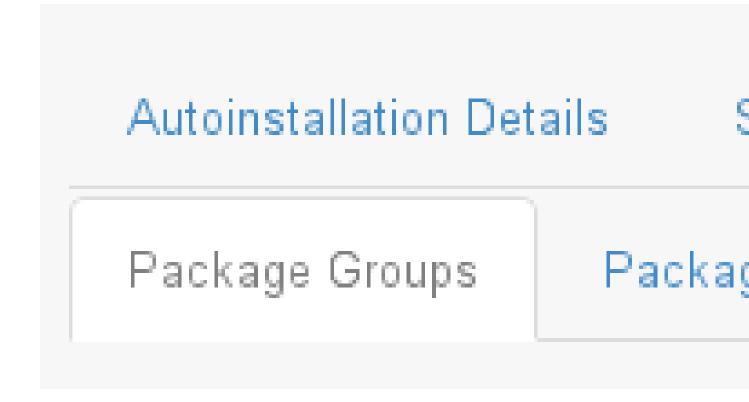

From this subtab, change information that may help with troubleshooting hardware problems:

#### Bootloader

For some headless systems, it is better to select the non-graphic LILO bootloader.

#### **Kernel Parameters**

Enter kernel parameters here that may help to narrow down the source of hardware issues.

The image above shows subtabs that are available from the Software tab.

Enter the package groups, such as <u>@office</u> or <u>@admin-tools</u> you would like to install on the kickstarted system in the large text box. If you would like to know what package groups are available, and what packages they contain, refer to the RedHat/base/ file of your Kickstart tree.

#### 8.3.1.15 Software > Package Profiles

If you have previously created a Package Profile from one of your registered systems, you can use that profile as a template for the files to be installed on a kickstarted system. Refer to *Section 7.3.2.2, "System Details > Software > Packages"* for more information about package profiles.

#### 8.3.1.16 Activation Keys

#### FIGURE 8.2: ACTIVATION KEYS

The <u>Activation Keys</u> tab allows you to select Activation Keys to include as part of the Kickstart profile. These keys, which must be created before the Kickstart profile, will be used when reregistering kickstarted systems.

#### 8.3.1.17 Scripts

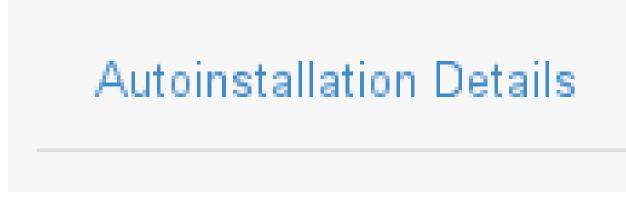

FIGURE 8.3: SCRIPTS

The <u>Scripts</u> tab is where <u>%pre</u> and <u>%post</u> scripts are created. This page lists any scripts that have already been created for this Kickstart profile. To create a Kickstart script, perform the following procedure:

- 1. Click the add new kickstart script link in the upper right corner.
- 2. Enter the path to the scripting language used to create the script, such as /usr/bin/perl.

- 3. Enter the full script in the large text box.
- 4. Indicate whether this script is to be executed in the <u>%pre</u> or <u>%post</u> section of the Kickstart process.
- 5. Indicate whether this script is to run outside of the chroot environment. Refer to the *Post-installation Script* section of the *Red Hat Enterprise Linux System Administration Guide* for further explanation of the nochroot option.

### Note

Uyuni supports the inclusion of separate files within the Partition Details section of the Kickstart profile. For instance, you may dynamically generate a partition file based on the machine type and number of disks at {kickstart} time. This file can be created via <u>%pre</u> script and placed on the system, such as <u>/tmp/part-include</u>. Then you can call for that file by entering the following line in the Partition Details field of the *System Details > Partitioning* tab:

%include /tmp/part-include

#### 8.3.1.18 Autoinstallation File

# Autoinstallation Details

#### FIGURE 8.4: AUTOINSTALLATION FILE

The <u>Autoinstallation File</u> tab allows you to view or download the profile that has been generated from the options chosen in the previous tabs.

#### Upload Kickstart/AutoYaST File 8.3.2

Click the Upload Kickstart/Autoyast File link from the Systems > Autoinstallation page to upload an externally prepared AutoYaST or Kickstart profile.

- 1. In the first line, enter a profile Label for the automated installation. This label[] dropdown menu is only populated if one or more distributions have been created for the selected base channel (see Section 8.6, "Autoinstallation > Distributions").
- 2. Instead of selecting a specific tree, you can also check the box Always use the newest Tree for this base channel. This setting lets Uyuni automatically pick the latest tree that is associated with the specified base channels. If you add new trees later, Uyuni will always keep the most recently created or modified.
- 3. Select the Virtualization Type from the drop-down menu. For more information about virtualization, refer to Book "Advanced Topics", Chapter 11 "Virtualization".

## 🕥 Note

If you do not intend to use the autoinstall profile to create virtual guest systems, you can leave the drop-down set to the default choice KVM Virtualized Guest.

- 4. Finally, either provide the file contents with cut-and-paste or update the file from the local storage medium:
  - Paste it into the File Contents box and click Create, or
  - enter the file name in the File to Upload field and click Upload File.

Once done, four subtabs are available:

- Details
- Bare Metal
- Variables
- Autoinstallable File

# 8.4 Autoinstallation > Bare Metal

Lists the IP addresses that have been associated with the profiles created by your organization. Click either the range or the profile name to access different tabs of the Autoinstallation Details page.

#### Autoinstallation > GPG and SSL Keys 8.5

Lists keys and certificates available for inclusion in {kickstart} profiles and provides a means to create new ones. This is especially important for customers of Uyuni or the Proxy Server because systems kickstarted by them must have the server key imported into Uyuni and associated with the relevant {kickstart} profiles. Import it by creating a new key here and then make the profile association in the GPG and SSL keys subtab of the Autoinstallation Details page.

To create a key or certificate, click the Create Stored Key/Cert link in the upper-right corner of the page. Enter a description, select the type, upload the file, and click the *Update Key* button. A unique description is required.

### Important

The GPG key you upload to Uyuni must be in ASCII format. Using a GPG key in binary format causes anaconda, and therefore the {kickstart} process, to fail.

#### Autoinstallation > Distributions 86

The Distributions page enables you to find and create custom installation trees that may be used for automated installations.

## 🔊 Note

The Distributions page does not display distributions already provided. They can be found within the Distribution drop-down menu of the Autoinstallation Details page.

Before creating a distribution, you must make an installation data available, as described in the *SUSE Linux Enterprise Deployment Guide* (https://www.suse.com/documentation/sles-12/singlehtml/book\_sle\_deployment/book\_sle\_deployment.html ?) or, respectively, the *Kickstart Installations* chapter of the *Red Hat Enterprise Linux System Administration Guide*. This tree must be located in a local directory on the Uyuni server.

#### PROCEDURE: CREATING A DISTRIBUTION FOR AUTOINSTALLATION

- 1. To create a distribution, on the <u>Autoinstallable Distributions</u> page click <u>Create</u> Distribution in the upper right corner.
- 2. On the Create Autoinstallable Distribution page, provide the following data:
  - Enter a label (without spaces) in the <u>Distribution Label</u> field, such as <u>my-orgs-</u> sles-12-sp2 or my-orgs-rhel-as-7.
  - In the *Tree Path* field, paste the path to the base of the installation tree.
  - Select the matching distribution from the <u>Base Channel</u> and <u>Installer Genera-</u> <u>tion</u> drop-down menus, such as <u>SUSE Linux</u> for SUSE Linux Enterprise, or <u>Red Hat</u> Enterprise Linux 7 for Red Hat Enterprise Linux 7 client systems.
- 3. When finished, click the Create Autoinstallable Distribution button.

#### 8.6.1 Autoinstallation > Distributions > Variables

Autoinstallation variables can be used to substitute values into Kickstart and AutoYaST profiles. To define a variable, create a name-value pair (name/value) in the text box.

For example, if you want to autoinstall a system that joins the network of a specified organization (for example the Engineering department) you can create a profile variable to set the IP address and the gateway server address to a variable that any system using that profile will use. Add the following line to the Variables text box.

```
IPADDR=192.168.0.28
GATEWAY=192.168.0.1
```

To use the distribution variable, use the name of the variable in the profile to substitute the value. For example, the network part of a {kickstart} file looks like the following:

network --bootproto=static --device=eth0 --onboot=on --ip= $IPADDR \$ 

The \$IPADDR will be resolved to 192.168.0.28, and the \$GATEWAY to 192.168.0.1.

#### Note

There is a hierarchy when creating and using variables in Kickstart files. System Kickstart variables take precedence over Profile variables, which in turn take precedence over Distribution variables. Understanding this hierarchy can alleviate confusion when using variables in {kickstart}s.

In AutoYaST profiles you can use such variables as well.

Using variables are just one part of the larger Cobbler infrastructure for creating templates that can be shared between multiple profiles and systems. For more information about Cobbler and templates, refer to *Book "Advanced Topics", Chapter 10 "Cobbler"*.

## 8.7 Autoinstallation > File Preservation

Collects lists of files to be protected and re-deployed on systems during {kickstart}. For instance, if you have many custom configuration files located on a system to be kickstarted, enter them here as a list and associate that list with the Kickstart profile to be used.

To use this feature, click the <u>Create File Preservation List</u> link at the top. Enter a suitable label and all files and directories to be preserved. Enter absolute paths to all files and directories. Then click *Create List*.

#### Important

Although file preservation is useful, it does have limitations. Each list is limited to a total size of 1 MB. Special devices like <u>/dev/hda1</u> and <u>/dev/sda1</u> are not supported. Only file and directory names may be entered. No regular expression wildcards can be used.

When finished, you may include the file preservation list in the Kickstart profile to be used on systems containing those files. Refer to *Section 8.3.1, "Create a Kickstart Profile"* for precise steps.

# 8.8 Autoinstallation > Autoinstallation Snippets

Use snippets to store common blocks of code that can be shared across multiple Kickstart or AutoYaST profiles in Uyuni.

# 8.8.1 Autoinstallation > Autoinstallation Snippets > Default Snippets

Default snippets coming with Uyuni are not editable. You can use a snippet, if you add the <u>Snippet Macro</u> statement such as <u>\$SNIPPET('spacewalk/sles\_register\_script')</u> to your autoinstallation profile. This is an AutoYaST profile example:

```
<init-scripts config:type="list">
  $SNIPPET('spacewalk/sles_register_script')
</init-scripts>
```

When you create a snippet with the <u>Create Snippet</u> link, all profiles including that snippet will be updated accordingly.

# 8.8.2 Autoinstallation > Autoinstallation Snippets > Custom Snippets

This is the tab with custom snippets. Click a name of a snippet to view, edit, or delete it.

#### 8.8.3 Autoinstallation > Autoinstallation Snippets > All Snippets

q The <u>All Snippets</u> tab lists default and custom snippets together.

# 8.9 Systems > Virtual Host Managers

Third party hypervisors and hypervisor managers such as VMWare vCenter are called "Virtual Host Managers" (VHM) within Uyuni. These managers can manage one or multiple virtual hosts, which in turn may contain virtual guests. Uyuni ships with a tool called <u>virtual-host-gath-</u>erer that can connect to VHMs using their API, and request information about virtual hosts.

This tool is automatically invoked via Taskomatic nightly, therefore you need to configure your VHMs via XMLRPC APIs. <u>virtual-host-gatherer</u> maintains the concept of optional modules, where each module enables a specific Virtual Host Manager.

Proceed to *Systems* > *Virtual Host Managers* page in the Web UI to begin working with a Virtual Host Manager. In the upper right click *Create* and select either VMware-based or File-based.

#### 8.9.1 VMware-Based

After selecting *Create* > *VMware-based* enter the location of your VMware-based virtual host. Enter a <u>Label</u>, <u>Hostname</u>, <u>Port</u>, <u>Username</u> and <u>Password</u>. Finally click the *Add Virtual Host Manager* button. For detailed information on working with a VMware-based Virtual Host Manager, see *Book "Advanced Topics", Chapter 12 "Inventorying vCenter/vSphere ESXi Hosts with Uyuni"*.

| 🖾 Add a VMWare-based | d Virtual Host Manager 🍳 |                      |  |
|----------------------|--------------------------|----------------------|--|
| Gatherer module:     | vmware                   |                      |  |
| Label *:             | testing                  |                      |  |
| Hostname *:          | example.com              |                      |  |
| Port *:              | 443                      |                      |  |
| Username *:          | tux                      |                      |  |
| Password *:          |                          |                      |  |
|                      | + Create                 | K Back Sclear fields |  |

#### 8.9.2 File-Based

In a VMWare environment where direct connection to the SUSE Manager Server is not possible, a JSON file can be exported from the ESXi or vSphere host and later imported into Uyuni via this option.

After selecting *Create* > *File-Based* enter a label and URL leading to the location of this file.

| 🖄 Add a File-based Virtual Host Manager ° |                              |  |  |
|---|------------------------------|--|--|
| Gatherer module:                          | file                         |  |  |
| Label *:                                  | testing                      |  |  |
| Url *:                                    | example.com                  |  |  |
|   | + Create Sack S Clear fields |  |  |

## Note: VMWare vCenter Installations without Direct Access

The file-based is not meant to be used with manually crafted files. It only meant to be used with the output of <u>virtual-host-gatherer</u> against some other module. File-based is suitable for VMWare vCenter installations for which no direct API access is possible from the SUSE Manager Server.

The solution is to run <u>virtual-host-gatherer</u> from somewhere else in the network and save the produced JSON data for further processing.

The following JSON data is an example of the exported information in the file:

```
{
    "examplevhost": {
        "10.11.12.13": {
            "cpuArch": "x86_64",
            "cpuDescription": "AMD Opteron(tm) Processor 4386",
            "cpuMhz": 3092.212727,
            "cpuVendor": "amd",
            "hostIdentifier": "'vim.HostSystem:host-182'",
            "name": "11.11.12.13",
            "os": "VMware ESXi",
            "osVersion": "5.5.0",
            "ramMb": 65512,
            "totalCpuCores": 16,
            "totalCpuSockets": 2,
            "totalCpuThreads": 16,
            "type": "vmware",
            "vms": {
                "vCenter": "564d6d90-459c-2256-8f39-3cb2bd24b7b0"
            }
        },
        "10.11.12.14": {
            "cpuArch": "x86 64",
            "cpuDescription": "AMD Opteron(tm) Processor 4386",
            "cpuMhz": 3092.212639,
            "cpuVendor": "amd",
            "hostIdentifier": "'vim.HostSystem:host-183'",
            "name": "10.11.12.14",
            "os": "VMware ESXi",
            "osVersion": "5.5.0",
            "ramMb": 65512,
            "totalCpuCores": 16,
            "totalCpuSockets": 2,
```

For more information, see the man page on your Uyuni server for virtual-host-gatherer:

{prompt.user}man virtual-host-gatherer

The <u>README</u> file coming with the package provides background information about the <u>type</u> of a hypervisor, etc.:

/usr/share/doc/packages/virtual-host-gatherer/README.md

#### 8.9.3 Configuring Virtual Host Managers via XMLRPC API

The following APIs allow you to get a list of available <u>virtual-host-manager</u> modules and the parameters they require:

virtualhostmanager.listAvailableVirtualHostGathererModules(session)

virtualhostmanager.getModuleParameters(session, moduleName)

The following APIs allow you to create and delete VHMs. The module parameter map must match the map returned by virtualhostmanager.getModuleParameters to work correctly:

virtualhostmanager.create(session, label, moduleName, parameters)

virtualhostmanager.delete(session, label)

#### The following APIs return information about configured VHMs:

```
virtualhostmanager.listVirtualHostManagers(session)
```

virtualhostmanager.getDetail(session, label)

•

# 9 Salt

Open *Main Menu* > *Salt* from the left navigation sidebar. *Main Menu* > *Salt* > *Keys* provides an overview of your Salt minions (clients). Use <u>Remote Commands</u> to execute remote commands on your Salt minions. You can also define a <u>State Catalog</u> for creating a collection of salt system states.

# 9.1 Keys

The <u>Keys</u> page provides a summary of your minions, including their names, fingerprints, state, and actions you may perform on them.

Once you have pointed a minion to the Uyuni server as its master within <u>/etc/salt/minion</u>, you can choose to accept or reject a minion from this page. Toggle the check mark or cross in the actions column.

|                       | Items 1 - 2 of 2  | 25       | items per page |
|-----------------------|---|----------|----------------|
| Name (12)             | Fingerprint   | State    | Action         |
| doc-minion-1.tf.local | d4:a0:cd:4f:52:89:0d:63:21:70:dd:bd:c5:c1:92:dd:9f:3b:01:87:31:4b:ec:e1:bc:1b:0f:12:22:db:5b:85 | accepted | Û              |
| doc-minion-2.tf.local | 3d:55:49:ae:0e:9e:0a:01:6c:9f:f0:93:3d:16:bd:c1:1d:87:98:fe:59:34:f1:0a:20:61:59:c3:d2:c1:31:02 | accepted | Û              |

FIGURE 9.1: KEYS OVERVIEW

For more information about key handling and onboarding, see *Book "Getting Started", Chapter 5 "Registering Clients", Section 5.5 "Registering Salt Clients".* 

# 9.2 Remote Commands

The remote commands page allows you to execute and run commands from the Uyuni server on several minions.

| Remote Commands 🤨                |     |                |
|----------------------------------|-----|----------------|
| ls -lha                          | @ * | Q Find targets |
| arget systems                    |     |                |
| o target systems have been found |     |                |

FIGURE 9.2: REMOTE COMMANDS

# Warning: Remote Commands Security

All commands run from the <u>Remote Commands</u> page are executed as root on minions. Wildcards can be used to run commands across any number of systems, so always take extra precaution as this may have drastic consequences for your systems.

On the *Salt* > *Remote Commands* page you will see two text boxes. The first box is for entering commands. The second box is for targeting minions by name, group, or by using wildcards.

Input a command you want to execute, add a target minion, group, or wildcard you want to execute the command on. Select the *Find Targets* button to verify which machines will be targeted. Select the *Run Command* button to execute a command on selected systems.

# 9.3 Formula Catalog

The Formula Catalog feature is a technology preview.

# 10 Images

# 10.1 Images

Uyuni enables system administrators to build system images, virtual images, containers and similar with the help of profiles and create image stores.

For background information, see Book "Advanced Topics", Chapter 8 "Image Building and Management".

If you click *Main Menu > Images > Images*, an overview listing of your images appears. Several columns provide information about each image:

| Images <sup>₽</sup>           | Limport C Refresh   |
|-------------------------------|---------------------|
| Items 0 - 0 of 0 Select All   | 25 💌 items per page |
| There are no entries to show. |                     |
| Page 1 of 1                   |                     |

- Select box: To select images, mark the appropriate check boxes. Selected images can be deleted simultaneously via the *Delete* button that appears in the upper right corner while selecting images.
- Name:
- Version and Revision:
- Updates: Shows which type of update action is applicable to the image or confirms that the image is up-to-date. For more information about these icons, see *Chapter 7, Systems*.
- Patches and Packages:
- Build:
- Last Modified: Time when the images was modified last.
- Actions : *Details* and *Delete* button. *Details* opens a the Image Details page.

In the upper right corner offers several action buttons: The *Delete* button appears when one or more images are selected. *Import* and *Refresh* are default buttons. *Import* allows to import pre-built images; for more information, see *Book "Advanced Topics"*, *Chapter 8 "Image Building and Management"*, *Section 8.2 "Container Images"*, *Section 8.2.7 "Importing an Image"*.

#### 10.1.1 Image Details

The Image Details page contains the Overview, Patches, and Packages tabs.

# 10.2 Build

If you click menu::Main Menu[Images > Build], the dialog for building images appears:

| 📽 Build Imag     | e 🕫  |                     |
|------------------|--|---------------------|
| Version:         | latest   | Profile Summary     |
| Image Profile *: | Select an image profile                                  | No profile selected |
| Build Host *:    | Select a build host                                      |                     |
| (j€arliest:      | 18:0         05.06.'         0         18:0         CEST |                     |
| CAdd to:         | new action chain *                                       |                     |
|                  | og Build   |                     |
|                  |  |                     |

- <u>Version</u> : The version string that you would like to see in the Images listing, applicable only to containers.
- Build Profile : Select an Image Profile created with the Main Menu > Images > Profiles page.
- Build Host : Select a Build Host.
- Earliest : Schedule build time.

Confirm with *Build* to start image building. When the image is done, find it listed in the <u>Images</u> overview described in *Section 10.1, "Images"*.

# 10.3 Profiles

If you click *Main Menu* > *Images* > *Profiles*, a listing of your <u>Image Profiles</u> appears. Several columns provide information about each image:

- Select box: To select image profiles, mark the appropriate check boxes. Selected profiles can be deleted simultaneously via the *Delete* button that appears in the upper right corner while selecting profiles.
- Label : The name of the profile.
- Build Type : Dockerfile is available. Use Dockerfile to build containers.
- <u>Actions</u> : *Build* , *Edit* and *Delete* button. *Build* creates the image according to this profile. *Edit* opens a the Profile Details page for editing.

*Refresh* and *Create* are default buttons in the upper right corner. *Create* opens the <u>Create Image</u> Profile dialog:

| 🖋 Create Image Profile | <u>j</u>                                  |
|------------------------|---|
| Label *:               |   |
| Image Type *:          | Dockerfile                                |
| Target Image Store *:  | Select an image store                     |
| Path *:                |   |
|                        | Format: giturl#branch:dockerfile_location |
| Activation Key:        | None                                      |
| Custom Info Values:    | Create additional custom info values      |
|                        | + Create                                  |
|                        |   |

# 10.4 Stores

If you click *Main Menu > Images > Stores*, a listing of your <u>Image Stores</u> appears. Several columns provide information about each store:

| Image Stores ⁰                | $oldsymbol{\mathcal{C}}$ Refresh | + Create    |
|-------------------------------|----------------------------------|-------------|
| Items 0 - 0 of 0 Select All   | 25 titer                         | ns per page |
| There are no entries to show. |                                  |             |
| Page 1 of 1                   |                                  |             |

- Select box: To select image stores, mark the appropriate check boxes. Selected stores can be deleted simultaneously via the *Delete* button that appears in the upper right corner while selecting stores.
- Label : Name of the store.
- Type : Currently, only Registry is available.
- Actions : *Edit* and *Delete* button. *Edit* opens a the Store Details page for editing.

In the upper right corner offers several action buttons: The *Delete* button appears when one or more stores are selected. *Refresh* and *Create* are default buttons. *Create* opens the <u>Create Image</u> Store dialog:

| 🖋 Create Image Profile | 5   |                |
|------------------------|---|----------------|
| Label *:               |   |                |
| Image Type *:          | Dockerfile                                | <u> </u>       |
| Target Image Store *:  | Select an image store                     | •              |
| Path *:                |   |                |
|                        | Format: giturl#branch:dockerfile_location |                |
| Activation Key:        | None                                      | •              |
| Custom Info Values:    | Create additional custom info values      | <b>_</b>       |
|                        | + Create                                  | 🍠 Clear fields |
|                        |   |                |

# Note: Image stores for Kiwi build type

Image stores for Kiwi build type are not supported yet. Kiwi build type is used to build system, virtual, and other images.

Images are always stored in /srv/www/os-image/<organization id>.

# 11 Patches

The *Main Menu* > *Patches* menu from the left bar helps tracking the availability and application of patches to your managed systems.

The *Main Menu* > *Patches* > *Patches* page displays all or relevant patches for at least one of your managed systems that have not been applied yet.

# Note: Receiving Patches for Your System

To receive an e-mail when patches are issued for your system, go to *Main Menu* > *Home* > *Your Preferences* and select Receive email notifications.

SUSE distinguishes three types of patches: security updates, bug fix updates, and enhancement updates. Each patch consists of a summary of the problem and solution, including the RPM packages fixing the problem.

Icons are used to identify the three types:

- **D**\_Security Updates available, *strongly* recommended
- Bug Fix Updates available, recommended
- Enhancement Updates available, optional

A summary of each patch is provided in list form displaying its type, advisory ID, synopsis (with the severity as a textual prefix in case of security updates, such as "critical", "important", "moderate", or "low"), number of affected systems in your network, and date updated.

In addition, you may view patches by product line at the following location: http:// download.suse.com/patch/psdb/ . For more information on security updates, see https:// www.suse.com/support/security/ .

# 11.1 Relevant

The <u>Relevant</u> patches page displays a customized list of patches applying to your registered systems.

| 🔊 Pato          | ches Releva   | nt to Your Syste | ems 🕫  |         |         |
|-----------------|---|------------------|--------|---------|---------|
| All Types       | All Types Bugfix Patches Enhancement Patches Security Patches                               |                  |        |         |         |
| The following p | The following patches apply to at least one system to which you have administrative access. |                  |        |         |         |
|                 |   |                  |        |         |         |
| Туре            | Advisory  | Syr              | nopsis | Systems | Updated |
|                 | Advisory<br>Relevant to Your System   |                  | nopsis | Systems | Updated |

Clicking an <u>Advisory</u> ID of a patch takes you to the <u>Details</u> page of the <u>Patch</u> <u>Details</u> page. Clicking the number of associated systems takes you to the <u>Affected</u> <u>Systems</u> page of the Patch Details page. Refer to *Section 11.2.2, "Patch Details"* for more information.

# 11.2 All

The <u>All</u> patches page displays a list of all patches released by SUSE, irrelevant of whether they apply to your registered systems or not.

|                        | 2S <sup>0</sup>                  |                            |         |         |  |
|------------------------|----------------------------------|----------------------------|---------|---------|--|
| All Types Bug          | fix Patches Enhancemen           | t Patches Security Patches |         |         |  |
| he following patch lis | st represents all patches access | ible by your organization. |         |         |  |
| Туре                   | Advisory                         | Synopsis                   | Systems | Updated |  |
| No Patches             |                                  |                            |         |         |  |

Like in the <u>Relevant Patches</u> page, clicking either <u>Advisory</u> or the number of systems affected takes you to related tabs of the <u>Patch Details</u> page. Refer to *Section 11.2.2, "Patch Details"* for more information.

#### 11.2.1 Applying Patches

Patches include a list of updated packages. To apply patches to a system, the system must be entitled.

Apply all applicable patches to a system by clicking Main Menu > Systems > Systems. Click the name of an entitled system. Then open the System Details > Software > Patches subtab. When the relevant patch list appears, click Select All then Apply Patches. Only patches not scheduled, scheduled but failed, or canceled patches are listed. Pending updates are excluded.

In addition, users with appropriate roles can apply patches using two other methods:

- To apply a specific patch to one or more systems, locate it in the patch list and click the number of systems affected, which takes you to the Affected Systems page of the Patch Details page. Select the individual systems to be updated and click the Apply Patches button. Double-check the systems to be updated on the confirmation page, then click the Confirm button.
- To apply more than one patch to one or more systems, select the systems from the Main Menu > Systems > Systems list. Click the Main Menu > Systems > System Set Manager > Overview, then click the Systems tab. After ensuring the appropriate systems are selected, click the Patches tab, select the patches to apply, and click the Apply Patches button. Schedule a date and time for the patch to be applied. Default is the current date. Click the Confirm button. You can follow the progress of the patch application via the Pending Actions list. Refer to Chapter 16, Schedule for more details.

## Important

If you use scheduled package installation, the packages or patches are installed via the Uyuni daemon (rhnsd). You must enable the Uyuni daemon on your systems. For more information about the Uyuni daemon, see Book "Best Practices", Chapter 8 "Contact Methods", Section 8.2 "Default (the Uyuni Daemon rhnsd)".

The following rules apply to patches:

- Each package is a member of one or more channels. If a selected system is not subscribed to a channel containing the package, the update will not be installed on that system.
- If a newer version of the package is already installed on the system, the update will not be installed.
- If an older version of the package is installed, the package will be upgraded.

#### 11.2.2 Patch Details

If you click the advisory of a patch in the <u>Relevant</u> or <u>All</u> pages, its <u>Patch Details</u> page appears. This page is further divided into the following tabs:

#### 11.2.2.1 *Patch Details > Details*

This subtab displays the patch report issued by SUSE. It provides a synopsis of the patch first (with the severity as a textual prefix in case of security updates, such as "critical", "important", "moderate", or "low"), issue date, and any update dates. This is followed by a description of the patch and the steps required to resolve the issue.

Below the <u>Affected Channels</u> label, all channels that contain the affected package are listed. Clicking a channel name displays the <u>Packages</u> subtab of the <u>Channel Details</u> page for that channel. Refer to *Section 12.1.7, "Channel Details"* for more information.

Security updates list the specific vulnerability as tracked by http://cve.mitre.org и. This information is listed below the CVEs label.

OVAL is an open vulnerability and assessment language promoted by Mitre, http:// oval.mitre.org  $\square$ . Clicking the link below the <u>Oval</u> label downloads this information to your system. More useful are the SUSE Update Advisories at https://www.suse.com/support/update/ $\square$ .

#### 11.2.2.2 Patch Details > Packages

This page provides links to each of the updated RPMs by channel. Clicking the name of a package displays its Package Details page.

#### 11.2.2.3 Patch Details > Affected Systems

This page lists systems affected by the patches. You can apply updates here. (See Section 11.2.1, "Applying Patches".) Clicking the name of a system takes you to its <u>System Details</u> page. Refer to Section 7.3, "System Details" for more information.

To determine whether an update has been scheduled, refer to the <u>Status</u> column in the affected systems table. Possible values are: N/A, Pending, Picked Up, Completed, and Failed. This column identifies only the last action related to a patch. For example, if an action fails and you reschedule it, this column shows the status of the patch as pending with no mention of the previous failure. Clicking a status other than N/A takes you to the <u>Action Details</u> page. This column corresponds to one on the Patch tab of the System Details page.

# 11.3 Advanced Search

The *Main Menu > Patches > Advanced Search* page allows you to search through patches by specific criteria.

| <b>Q</b> Advanced Searc  | ch 🤨  |  |  |  |
|--|---|--|--|--|
| Advanced Search will return results from the complete set of patches released by SUSE Manager. |   |  |  |  |
| Specify your search criteria b   | pelow.  |  |  |  |
| Search For:  |   | Examples: 'kernel', 'slessp1-glibc'  |  |  |
| What to search:  | All Fields  | Tip: Use 'all fields' to search synopsis, description, topic, or solution. |  |  |
| Types of Patches to Search:.   | <ul> <li>孫 Bug Fix Advisory</li> <li>ジ Security Advisory</li> <li>ご Product Enhancement Advisory</li> </ul> |  |  |  |
| Issue Dates to Search:   | Search by Issue Dates:  |  |  |  |
| Fine Grained Search:   | □ Fine grained search results   |  |  |  |
|  | Q Search  |  |  |  |

- All Fields Search patches by synopsis, description, topic, or solution.
- Patch Advisory The name or the label of the patch.
- Package Name Search particular packages by name:

kernel

Results will be grouped by advisory. For example, searching for 'kernel' returns all package names containing the string kernel, grouped by advisory.

• <u>CVE</u> — The name assigned to the security advisory by the Common Vulnerabilities and Exposures (CVE) project at http://cve.mitre.org **?**. For example:

CVE-2006-4535

To filter patch search results, check or uncheck the boxes next to the type of advisory:

- Bug Fix Advisory Patches that fix issues reported by users or discovered during development or testing.
- Security Advisory Patches fixing a security issue found during development, testing, or reported by users or a software security clearing house. A security advisory usually has one or more CVE names associated with each vulnerability found in each package.
- Product Enhancement Advisory Patches providing new features, improving functionality, or enhancing performance of a package.

# 11.4 Manage Patches

Custom patches enable organizations to issue patch alerts for the packages in their custom channels, schedule deployment and manage patches across organizations.

| 🕺 Patches Management ° |   |          | + Create Pat  |
|------------------------|---|----------|---------------|
|                        | Patches<br>h list represents patches owned by your or<br>advisory to edit the patch details or the list | -        |               |
|                        |   |          | Delete Patche |
| Туре                   | Advisory  | Synopsis | Updated       |
|                        | ches  |          |               |

# Warning

If the organization is using both Uyuni and Uyuni Proxy server, then manage patches only on the Uyuni server since the proxy servers receive updates directly from it. Managing patches on a proxy in this combined configuration risks putting your servers out of synchronization.

## 11.4.1 Creating and Editing Patches

To create a custom patch alert, proceed as follows:

1. Click *Main Menu* > *Patches* > *Manage Patches* > *Published*. Then on the <u>Patches Management</u> page, click Create Patch.

| 🔊 Patches Managem                           | nent               |  |
|---|--------------------|--|
| Create Patch                                |                    |  |
| Create new patch here. Required items are r | marked with a (*). |  |
| Synopsis*:                                  |                    |  |
| Advisory*:                                  |                    |  |
| Advisory Release*:                          | 1                  |  |
| Advisory Type*:                             | Bug Fix Advisory   |  |
| Advisory Severity:                          | Critical           |  |
| Product*:                                   |                    |  |
| Author:                                     |                    |  |
| Topic*:                                     |                    |  |
|   |                    |  |
|   |                    |  |
| Description*:                               |                    |  |
|   |                    |  |
|   |                    |  |
| Solution*:                                  |                    |  |
|   |                    |  |
|   |                    |  |
|   |                    |  |
|   | Bugs:              |  |
| ID:   |                    |  |
| Summary:                                    |                    |  |
| Bugzilla URL:                               |                    |  |
| Keywords:                                   |                    |  |
|   | (Comma delimited)  |  |
| References:                                 |                    |  |
|   |                    |  |
|   |                    |  |
| Notes:                                      |                    |  |
|   |                    |  |
|   |                    |  |
|   | Create Patch       |  |
|   |                    |  |

- 1. Enter a label for the patch in the <u>Advisory</u> field, ideally following a naming convention adopted by your organization.
- 2. Complete all remaining required fields, then click the *Create Patch* button. View standard SUSE Alerts for examples of properly completed fields.

Patch management distinguishes between published and unpublished patches.

- <u>Published</u>: this page displays the patch alerts the organization has created and disseminated. To edit an existing published patch, follow the steps described in *Section 11.4.1*, *"Creating and Editing Patches"*. To distribute the patch, click *Send Notification* in the <u>Send</u>
   <u>Patch Mail</u> section on the top of the <u>Patch Details</u> page. The patch alert is sent to the administrators of all affected systems.
- <u>Unublished</u> : this page displays the patch alerts your organization has created but not yet distributed. To edit an existing unpublished patch, follow the steps described in *Section 11.4.1, "Creating and Editing Patches"*. To publish the patch, click *Publish Patch* on the top-right corner of the <u>Patch Details</u> page. Confirm the channels associated with the patch and click the *Publish Patch* button, now in the lower-right corner. The patch alert is moved to the Published page awaiting distribution.

Uyuni administrators can also create patches by cloning an existing one. Cloning preserves package associations and simplifies issuing patches. See *Section 11.5, "Cloning Patches"* for instructions.

To edit an existing patch alert's details, click its advisory on the <u>Patches Management</u> page, make the changes in the appropriate fields of the <u>Details</u> tab, and click the *Update Patch* button. Click the <u>Channels</u> tab to alter the patch's channel association. Click the <u>Packages</u> tab to view and modify its packages.

To delete patches, select their check boxes on the <u>Patches Management</u> page, click the *Delete Patches* button, and confirm the action. Deleting published patches might take a few minutes.

## 11.4.2 Assigning Packages to Patches

To assign packages to patches, proceed as follows:

- 1. Select a patch, click the Packages tab, then the Add subtab.
- 2. To associate packages with the patch being edited, select the channel from the <u>View</u> dropdown box that contains the packages and click *View*. Packages already associated with the patch being edited are not displayed. Selecting <u>All managed packages</u> presents all available packages.
- 3. After clicking *View*, the package list for the selected option appears. Note that the page header still lists the patch being edited.
- 4. In the list, select the check boxes of the packages to be assigned to the edited patch and click *Add Packages*.
- 5. A confirmation page appears with the packages listed. Click *Confirm* to associate the packages with the patch. The <u>List/Remove</u> subtab of the <u>Managed Patch Details</u> page appears with the new packages listed.

When packages are assigned to a patch, the patch cache is updated to reflect the changes. This update is delayed briefly so that users may finish editing a patch before all the changes are made available. To initiate the changes to the cache manually, follow the directions to *commit the changes immediately* at the top of the page.

### 11.4.3 Publishing Patches

After adding packages to the patch, the patch needs to be published to be disseminated to affected systems. Follow this procedure to publish patches:

- 1. On the top navigation bar, click *Main Menu > Patches > Manage Patches > Unpublished* to see all the unpublished patches listed.
- 2. Click the patch Advisory name to open the patch details pages.
- 3. On the patch details page, click *Publish Patch*. A confirmation page appears that will ask you to select which channels you want to make the patch available in. Choose the relevant channels.
- 4. At the bottom of the page, click *Publish Patch*. The patch published will now appear on the Published page of Manage Patches.

### 11.4.4 Published

Here all published patches are listed. It is possible to perform the following actions:

- To create a patch, click Create Patch.
- To delete patches, select them first and then click *Delete Patches*.
- Click an Advisory name to open the patch details page.

### 11.4.5 Unpublished

Here all published patches are listed. It is possible to perform the same actions as with published patches. For more information, see *Section 11.4.4, "Published"*. Additionally, on a patch details page, you can click *Publish Patch* for publishing.

## 11.5 Cloning Patches

Patches can be cloned for easy replication and distribution as part of Uyuni.

| 🔊 Patches Management °  |                         |                           |                         |  |   |         |  |

|   |                         |                           |                         |  | Clone P                                     | atches  |  |

Only patches potentially applicable to one of your channels can be cloned. Patches can be applicable to a channel if that channel was cloned from a channel to which the patch applies. To access this functionality, click *Main Menu* > *Patches* > *Clone Patches*.

On the <u>Clone Patches</u> page, select the channel containing the patch from the <u>View</u> dropdown box and click *View*. When the patch list appears, select the check box of the patch to be cloned and click *Clone Patch*. A confirmation page appears with the patch listed. Click *Confirm* to finish cloning. The cloned patch appears in the <u>Unpublished</u> patch list. Verify the patch text and the packages associated with that patch, then publish the patch so it is available to users in your organization.

## 12 Software

The pages in the *Main Menu* > *Software* category enable you to view and manage software channels and packages associated with your systems.

## 12.1 Channels

The *Main Menu* > *Software* > *Channels* page is the first to appear. A software channel provides packages grouped by products or applications to simplify the selection of packages to be installed on a system.

There are two types of software channels: base channels and child channels.

#### **Base Channels**

A base channel consists of packages built for a specific architecture and release. For example, all of the packages in SUSE Linux Enterprise Server 12 for the  $x86_64$  architecture make up a base channel. The list of packages in SUSE Linux Enterprise Server 12 for the s390x architecture make up a different base channel.

A system must be subscribed to only one base channel assigned automatically during registration based on the SUSE Linux Enterprise release and system architecture. For paid base channels, an associated subscription must exist.

#### **Child Channels**

A child channel is associated with a base channel and provides extra packages. For example, an organization can create a child channel associated with SUSE Linux Enterprise Server on  $\times 86_{64}$  architecture that contains extra packages for a custom application. Especially important are the Uyuni Tools channels that are available for every base channel. These tools channels provide the tools needed to connect the clients with the Uyuni server.

A system can be subscribed to multiple child channels of its base channel. Only packages provided by a subscribed channel can be installed or updated. Uyuni Administrators and Channel Administrators have channel management authority. This authority gives them the ability to create and manage their own custom channels.

## Note

Do not create child channels containing packages that are not compatible with the client system.

Channels can be further distinguished by relevance: <u>All</u>, <u>SUSE</u>, <u>Channels</u>, <u>My Channels</u>, Shared, and <u>Retired</u>.

### 12.1.1 All

Under *Main Menu* > *Software* > *Channels* select <u>All</u>. All channels available to your organization are listed.

| 🔢 Full Softw                       | are Cl      | hannel Lis           | st 🤨                               |          |   |                            |

Links within this list go to different tabs of the <u>Software</u> Channel <u>Details</u> page. Clicking a channel name takes you to the <u>Details</u> tab. Clicking the number of packages takes you to the <u>Packages</u> tab. Clicking the number of systems takes you to the <u>Subscribed Systems</u> tab. Refer to <u>Section 12.1.7</u>, "Channel Details" for details.

0

## Important: Package Count Update Change

During a channel synchronization all package are now downloaded before they are incremented and displayed within the Web UI. When packages have completed the initial download, packages will begin to increment in your channel as they are imported to the database.

### 12.1.2 SUSE

The SUSE page displays all SUSE channels and any available child channels.

## Warning: SUSEChannels Cannot be Deleted

When imported, SUSE channels cannot be deleted. Only custom software channels can be deleted.

## 12.1.3 Popular

The Popular page displays the software channels most subscribed by systems registered to your organization.

|        | Popular         | 0              |                     |                 |   |
|--------|-----------------|----------------|---------------------|-----------------|---|
| All    | SUSE            | Popular        | My Channels         | Shared          | Retired   |
| The so | ftware channel: | s listed below | are considered popu | ular (defined a | s having a certain number of systems subscribed). |
| Displ  | ay channels wit | h at least 10  | systems subs        | cribed below.   |   |
| Up     | date            |                |                     |                 |   |
| No cha | nnels found.    |                |                     |                 |   |

You can refine the search by using the drop-down box to list only the channels with at least a certain number of systems subscribed.

## 12.1.4 My Channels

The My Channels page displays all software channels that belong to your organization, including both SUSE and custom channels. Use the text box to filter by channel name.

| My Cl                               | nannels <sup>@</sup> |                      |                |          |  |

| Channel Name                        |                      |                      |                | Packages | Systems                                      |
| testchannel                         |                      |                      |                | 0        | 4  |
|                                     |                      |                      |                |          |  |

## 12.1.5 Shared

The Shared page displays the channels shared with others in the organizational trust.

## 12.1.6 Retired

The <u>Retired</u> page displays available channels that have reached their end-of-life dates and do not receive updates.

## 12.1.7 Channel Details

If you click the name of a channel, the Channel Details page appears.

### 12.1.7.1 Channel Details > Details

General information about the channel and its parent if applicable. This summary, description, and architecture is also displayed when clicking a channel.

|   | Enable   | GPG Check  | <b>₽</b><br>Update Chann  | sel  |                           |  |  |  |  |

In addition, <u>Per-User Subscription Restrictions</u> can be set globally by Uyuni administrators and channel administrators. By default, any user can subscribe channels to a system. To manage user permissions, select <u>Only selected users within your organization may</u> <u>subscribe to this channel</u> and click *Update*. The <u>Subscribers</u> tab appears. Click it to grant specific users subscription permissions to a channel. Uyuni administrators and channel administrators can always subscribe any channels to a system.

Only customers with custom base channels can change their systems' base channel assignments via the Uyuni Web interface in two ways:

- Assign the system to a custom base channel.
- Revert subscriptions from a custom base channel to the appropriate distribution-based base channel.

### Note

The assigned base channel must match the installed system. For example, a system running SUSE Linux Enterprise 11 for  $\underline{x86_{64}}$  cannot be registered to a SUSE Linux Enterprise 12 for  $\underline{s390x}$  base channel. Use the files  $\underline{/etc/os-release}$  or  $\underline{/etc/SuSE-re}$  lease to check your product, architecture (try uname -a), version, and patch level.

### 12.1.7.2 Channel Details > Managers

On the <u>Managers</u> page, you can check which users are authorized to manage the selected channel.

| 👭 testchanne                | 0   |   | 🗎 Delete software channel |
|-----------------------------|---|---|---------------------------|
| Details Managers            | Patches Packages Repositories                       |   |                           |
| Managers                    |   |   |                           |
| Selected users may manage t | his channel. Users with Admin Access (org admins or | r channel admins) may manage any channel. |                           |
| Select All Unselect A       | II 1 - 1 of 1 (1 selected)                          |   | Update                    |
| Filter by Username:         | ۲   |   | 25 🔹 items per page       |
| 🗆 Username 😫                | Real Name   | Email                                     | Status                    |
| 💀 admin                     | Administrator, Administrator                        | galaxy-noise@suse.de                      | enabled                   |
|                             |   |   |                           |
|                             |   |   |                           |

Real name and e-mail address are listed with the user names. Organization and Channel administrators can manage any channel. As a Uyuni administrator you can change roles for specific users by clicking the name. For more information on user management and the <u>User Details</u> page, see *Chapter 17*, *Users*.

### 12.1.7.3 Channel Details > Patches

The Patches page lists patches to be applied to packages provided in the channel.

The list displays advisory types, names, summaries, and issue dates. Clicking an advisory name takes you to its Patch Details page. for more information, see *Section 11.2.2, "Patch Details"*.

### 12.1.7.4 Channel Details > Packages

This page lists packages in the channel. Clicking a package name takes you to the <u>Package</u> Details page.

This page displays a set of tabs with information about the package, including architectures on which it runs, the package size, build date, package dependencies, change log, list of files in the package, newer versions, and which systems have the package installed. Download the packages as RPMs.

To search for a specific package or a subset of packages, use the package filter at the top of the list. Enter a substring to search for package names containing the string. For example, typing dd in the filter might return: dd\_rescue, ddclient, and uuidd. The filter is case-insensitive.

### 12.1.7.5 Channel Details > Subscribed Systems

The list displays system names and their system type. Clicking a system name takes you to its System Details page. For more information, see *Section 7.3, "System Details"*.

### 12.1.7.6 Software Channel Details > Target Systems

List of systems eligible for subscription to the channel. This tab appears only for child channels. Use the check boxes to select the systems, then click the <u>Confirm</u> and *Subscribe* button on the bottom right-hand corner. You will receive a success message or be notified of any errors. This can also be accomplished through the <u>Channels</u> tab of the <u>System Details</u> page. For more information, see Section 7.3, "System Details".

## 12.2 Package Search

| <b>Q</b> Package Search <sup>©</sup>        |  |   |  |
|---|--|---|--|
| Package Search will return packages from th | e specified set of software channels.                                  |   |  |
| Specify your search criteria below.         |  |   |  |
| Search For:                                 |  | Q |  |
|   |  |   |  |
| What to search:                             | Name and Summary   | - |  |
| Where to search:                            | Only channels relevant to your systems                                 |   |  |
|   | $_{\mbox{\scriptsize C}}$ Specific channel you have access to          |   |  |
|   | testchannel  | - |  |
|   | CPackages of a specific architecture in any channel you have access to |   |  |
|   | *IA-32<br>*IA-32 Debian<br>*IA-64<br>*IA-64 Debian<br>*Sparc Debian    | • |  |
|   | * means one or more channel architectures are not synchronized.        |   |  |
|   | ☐ Fine grained search results  |   |  |

The <u>Package Search</u> page allows you to search through packages using various criteria provided by the What to search for selection list:

- <u>Free Form</u> a general keyword search useful when the details of a particular package and its contents are unknown.
- Name Only Targeted search to find a specific package known by name.

- <u>Name and Summary</u> Search for a package or program which might not show up in the respective package name but in its one-line summary.
- Name and Description Search package names and their descriptions.

The <u>Free Form</u> field additionally allows you to search using field names that you prepend to search queries and filter results by that field keyword.

For example, if you wanted to search all of the SUSE Linux Enterprise packages for the word java in the description and summary, type the following in the Free Form field:

summary:java and description:java

Other supported field names include:

- name : search package names for a particular keyword,
- version: search for a particular package version,
- filename: search the package file names for a particular keyword,
- description: search the packages' detailed descriptions for a particular keyword,
- summary: search the packages' brief summary for a particular keyword,
- arch: search the packages by their architecture (such as x86\_64, ppc64le, or s390).

You can also limit searches to <u>Channels relevant to your systems</u> by clicking the check box. Additionally, you can restrict your search by platform (<u>Specific channel you have</u> access to) or architecture (Packages of a specific architecture).

## 12.3 Manage Software Channels

This menu allows administrators to create, clone, and delete custom channels. These channels may contain altered versions of distribution-based channels or custom packages.

### 12.3.1 Manage Software Channels > Overview

The <u>Overview</u> page of the <u>Manage Software Channels</u> menu lists all available channels including custom, distribution-based, and child channels.

To clone an existing channel, click the <u>Clone Channel</u> link. Select the channel to be cloned from the drop-down box, select whether to clone the current state (including patches) or the original state (without patches). You can also select specific patches to use for cloning. Then click the *Create Channel* button. In the next screen select options for the new channel, including base architecture and GPG, then click Create Channel.

## Note: GPG Key URL

The GPG key URL may be either an internal file location such as <u>file:///</u> or you may use an external URL.

To create a new channel, click the <u>Create Channel</u> link. Select the appropriate options for the new channel, including base architecture and GPG options, then click *Create Channel*. Note that a channel created in this manner is blank, containing no packages. You must either upload software packages or add packages from other repositories. You may also choose to include patches in your custom channel.

## Important: Enable GPG Check

Enable GPG Check is automatically selected when creating a new channel. If you would like to add custom packages and applications to your channel, make sure you deselect this box or you cannot install/add unsigned packages. Keep in mind this is a security risk for packages from an untrusted source.

## 12.3.2 `Channel Details

### 12.3.2.1 Channel Details > Details

This page lists the settings made during channel creation.

### 12.3.2.2 Channel Details > Managers

Uyuni administrators and channel administrators may alter or delete any channel. To grant other users rights to alter or delete this channel, check the box next to the user's name and click *Update*.

To allow all users to manage the channel, click the *Select All* button at the bottom of the list then click *Update*. To remove a user's right to manage the channel, uncheck the box next to their name and click *Update*.

### 12.3.2.3 Channel Details > Patches

Channel managers can list, remove, clone, and add patches to their custom channel. Custom channels not cloned from a distribution may not contain patches until packages are available. Only patches that match the base architecture and apply to a package in that channel may be added. Finally, only cloned or custom patches may be added to custom channels. Patches may be included in a cloned channel if they are selected during channel creation.

The <u>Sync</u> tab lists patches that were updated since they were originally cloned in the selected cloned channel. More specifically, a patch is listed here if and only if:

- it is a cloned patch,
- it belongs to the selected cloned channel,
- it has already been published in the selected cloned channel,
- it does not contain a package that the original patch has, or it has at least one package with a different version with regard to the corresponding one in the original patch, or both.
- Clicking the *Sync Patches* button opens a confirmation page in which a subset of those patches can be selected for synchronization.
- Clicking the *Confirm* button in the confirmation page results in such patches being copied over from the original channel to the cloned channel, thus updating corresponding packages.

### 12.3.2.4 Channel Details > Packages

As with patches, administrators can list, remove, compare, and add packages to a custom channel.

To list all packages in the channel, click the List / Remove Packages link. Check the box to the left of any package you want to remove, then click *Remove Packages*.

To add packages, click the <u>Add Packages</u> link. From the drop-down box activate a channel from which to add packages and click *View* to continue. Check the box to the left of any package you want to add to the custom channel, then click *Add Packages*.

To compare packages in the current channel with those in another, select a channel from the drop-down box and click *Compare*. Packages in both channels are compared, including architecture and the latest version of packages. The results are displayed on the next screen.

To make the two channels identical, click the *Merge Differences* button. In the next dialog, resolve any conflicts. *Preview Merge* allows you to review the changes before applying them to the channels. Select those packages that you want to merge. Click *Merge Packages* then *Confirm* to perform the merge.

### 12.3.2.5 Channel Details > Repositories

On the <u>Repositories</u> page, assign software repositories to the channel and synchronize repository content:

- <u>Add/Remove</u> lists configured repositories, which can be added and removed by selecting the check box next to the repository name and clicking *Update Repositories*.
- <u>Sync</u> lists configured repositories. The synchronization schedule can be set using the dropdown boxes, or an immediate synchronization can be performed by clicking *Sync Now*.

The Manage Repositories tab to the left shows all assigned repositories. Click a name to see details and possibly delete a repository.

## 12.3.3 Manage Software Channels > Manage Software Packages

This page allows managing custom software packages, listing all software or viewing only packages in a custom channel. Select the respective channel from the drop-down box and click *View Packages*.

## 12.3.4 Manage Software Channels > Manage Repositories

Add or manage custom or third-party package repositories and link the repositories to an existing channel. The repositories feature currently supports repomd repositories.

To create a new repository click the <u>Create Repository</u> link at the top right of the <u>Manage</u> <u>Repositories</u> page. The <u>Create Repository</u> screen prompts you to enter a <u>Repository</u> Label such as sles-12-x86\_64 and a Repository URL. You may enter URLs pointing to mirror lists or direct download repositories, then click Create Repository. Select the desired SSL certificate of authority, client certificate and key from the drop down list. SSL keys should be placed in http://EXAMPLE-MANAGER-FQDN.com/pub.

To link the new repository to an existing software channel, select Manage Software Channels from the left menu, then click the channel you want to link. In the channel's detail page, click the Repositories subtab, then check the box next to the repository you want to link to the channel. Click Update Repositories.

To synchronize packages from a custom repository to your channel, click the Sync link from the channel's Repositories subtab, and confirm by clicking the Sync button.

You can also perform a synchronization via command line by using the spacewalk-repo-sync command, which additionally allows you to accept keys.

spacewalk-repo-sync creates log files in the /var/log/rhn/reposync directory. Uyuni uses one log file per channel and reuses it with the next synchronization run.

#### 12.4 **Distribution Channel Mapping**

The Distribution Channel Mapping page displays a list of all your defined default base channels that clients will pick up according to their operating system and architecture at registration time. These mappings can be overriden, but cannot be deleted. To create such a mapping click Create Distribution Channel Mapping in the upper-right corner. Several columns provide information for each mapping.

## Note: Using Distribution Channel Mapping

For SUSE Linux Enterprise or Red Hat Enterprise Linux SUSE does not use the Distribution Channel Mapping feature. It can be used for other products (for example, for free products such as openSUSE, Fedora, Oracle Linux, etc.). It can help when letting clients pick up base channels automatically.

## 13 Audit

Select Main Menu > Audit to audit your managed systems.

## 13.1 CVE Audit

The *Main Menu* > *Audit* > *CVE Audit* page will display a list of client systems with their patch status regarding a given CVE (Common Vulnerabilities and Exposures) number.

| <b>Q</b> CVE Audit <sup>2</sup>   |                            |
|---|----------------------------|
| CVE 2018 -  |                            |
| Affected, patches available in channels which are not assigned  |                            |
| Affected, at least one patch available in an assigned channel   |                            |
| 🔽 🔵 Not affected  |                            |
| Patched   |                            |
| Audit Servers   |                            |
| Filter by name Items 0 - 0 of 0   | 25 🔹 items per page        |
| There are no entries to show.   |                            |
| Page 1 of 1   |                            |
| Download CSV<br>Please note that underlying data needed for this audit is updated nightly. If systems were registered very recently or channel subscriptions have be<br>hours it is recommended that an extra CVE data update is scheduled in order to ensure consistent results. | een changed in the last 24 |

## 13.1.1 Normal Usage

Proceed as follows if you want to verify that a client system has received a given CVE patch:

- 1. Make sure that the CVE data is up-to-date. For more information, see *Section 13.1.3, "Maintaining CVE Data"*.
- 2. Click *Main Menu > Audit > CVE Audit* to open the CVE Audit page.
- 3. Input a 13-char CVE identifier in the <u>CVE Number</u> field. The year setting will be automatically adjusted. Alternatively, set the year manually and add the last four digits.
- 4. Optionally, uncheck the patch statuses you are not interested in.
- 5. Click Audit systems.

Performing this procedure will result in a list of client systems, where each system comes with a Patch Status belonging to the given CVE identifier. Possible statuses are:

### Red - Affected, patches are available in channels that are not assigned The system is affected by the vulnerability and Uyuni has one or more patches for it, but at this moment, the channels offering the patches are not assigned to the system.

### Orange - Affected, at least one patch available in an assigned channel

The system is affected by the vulnerability, Uyuni has at least one patch for it in a channel that is directly assigned to the system.

### Grey - Not affected

The system does not have any packages installed that are patchable.

## Green - Patched

A patch has already been installed.

In other words, it can mean the following:

- More than one patch might be needed to fix a certain vulnerability.
- The Orange state is displayed when Uyuni has at least one patch in an assigned channel. This might mean that, after installing such a patch, others might be needed—users should double check the CVE Audit page after applying a patch to be sure that their systems are not affected anymore.

For a more precise definitions of these states, see Section 13.1.4, "Tips and Background Information".

## Note: Unknown CVE Number

If the CVE number is not known to Uyuni, an error message is displayed because Uyuni cannot collect and display any audit data.

For each system, the <u>Next Action</u> column contains suggestions on the steps to take to address the vulnerabilities. Under these circumstances it is either sensible to install a certain patch or assign a new channel. If applicable, a list of "candidate" channels or patches is displayed for your convenience.

You can also assign systems to a System Set for further batch processing.

### 13.1.2 API Usage

An API method called <u>audit.listSystemsByPatchStatus</u> is available to run CVE audits from custom scripts. Details on how to use it are available in the API guide.

### 13.1.3 Maintaining CVE Data

To produce correct results, CVE Audit must periodically refresh the data needed for the search in the background. By default, the refresh is scheduled at 11:00 PM every night. It is recommended to run such a refresh right after the Uyuni installation to get proper results immediately instead of waiting until the next day.

- 1. In the Web interface, click *Main Menu > Admin > Task Schedules*.
- 2. Click the cve-server-channels-default schedule link.
- 3. Click the cve-server-channels-bunch link.
- 4. Click the *Single Run Schedule* button.
- 5. After some minutes, refresh the page and check that the scheduled run status is FINISHED.

A direct link is also available on the *Main Main* > *Audit* > *CVE Audit* page (<u>extra CVE data</u> update).

## 13.1.4 Tips and Background Information

Audit results are only correct if the assignment of channels to systems did not change since the last scheduled refresh (normally at 11:00 PM every night). If a CVE audit is needed and channels were assigned or unassigned to any system during the day, a manual run is recommended. For more information, see *Section 13.1.3, "Maintaining CVE Data"*.

Systems are called "affected", "not affected" or "patched" not in an absolute sense, but based on information available to Uyuni. This implies that concepts such as "being affected by a vulnerability" have particular meanings in this context. The following definitions apply:

System affected by a certain vulnerability

A system which has an installed package with version lower than the version of the same package in a relevant patch marked for the vulnerability.

### System not affected by a certain vulnerability

A system which has no installed package that is also in a relevant patch marked for the vulnerability.

### System patched for a certain vulnerability

A system which has an installed package with version equal to or greater than the version of the same package in a relevant patch marked for the vulnerability.

### Relevant patch

A patch known by Uyuni in a relevant channel.

### **Relevant channel**

A channel managed by Uyuni, which is either assigned to the system, the original of a cloned channel which is assigned to the system, a channel linked to a product which is installed on the system or a past or future service pack channel for the system.

A notable consequence of the above definitions is that results can be incorrect in cases of unmanaged channels, unmanaged packages, or non-compliant systems.

## 13.2 Subscription Matching

To match subscriptions with your systems use the Subscription Matcher tool.

The <u>Edit Virtual Host Managers</u> link in the upper right corner will take you to the *Main Menu > Systems > Virtual Host Managers* overview. For more information about Virtual Host Managers, see *Section 8.9, "Systems > Virtual Host Managers"*.

It gathers information about systems, subscriptions and pinned matches (fixed customer defined subscriptions to systems mapping) as input and returns the best possible match according to the SUSE Terms and Conditions. The Subscription Matcher (<u>subscription-matcher</u>) is also able to write CSV Reports.

- The Subscriptions Report provides subscriptions report data when used
- The <u>Unmatched Products Report</u> provides information on products and their systems when a match to a subscription cannot be found
- The Error Report provides a list of errors raised during the matching process

Selecting *Main Menu > Audit > Subscription Matching* from the left navigation menu will provide you with an overview of all results generated by the Subscription Matcher.

Important: Subscription Matcher Accuracy

This tool's goal is to help provide visual coverage on current subscription use and support reporting. The Subscription Matcher is excellent at matching systems and products registered with Uyuni, however any systems, products or environments which are not found in the database will remain unmatched. This tool is not intended to act as a replacement for auditing. Auditing should always take precedence over subscription matching.

### 13.2.1 Main Menu > Audit > Subscription Matching > Subscriptions

The Subscription Matching overview provides subscription part numbers, product descriptions, policies, matched total subscriptions used and remaining, and the start and end dates of subscriptions.

| Filter by description |  | Items 1 - 10 of 16 |                            |               |              | 10 • items per page  |

FIGURE 13.1: SUBSCRIPTION MATCHING OVERVIEW

#### Part Number

Identifier of a particular product

#### Description

Name of a particular product

#### Policy

Kind of the subscription of this product

#### Matched/Total

Fully Matched. If the total amounts of a subscription are fully matched, the quantity

column value is highlighted with a yellow warning triangle:

•

Susbscritions about to Expire. When a subscription will expire within less than 3 months, the record is highlighted.

•

Expired Subscriptions. If a subscription is expired, the record for it is faded.

#### Start Date

Start date of the subscription

#### End Date

End date of the subscription

### 13.2.2 Subscription Matcher Reports

Uyuni automatically generates up-to-date nightly status reports by matching your SUSE subscriptions with all your registered systems. These reports are stored in <u>/var/lib/spacewalk/sub-scription-matcher</u> and provided in CSV format. These CSV files may be opened with a spread-sheet application such as LibreOffice Calc.

If you want to schedule these reports to be produced at different times, or at a certain frequency or schedule a one time completion you can perform this task by editing the Taskomatic settings for the gatherer-matcher located in the Web UI at *Main Menu* > *Admin* > *Task Schedules* > *gatherer-matcher-default*.

| 👫 Schedule gathere                        | r-matcher-default   |    | 🔒 delete schedule |

# 13.2.3 *Main Menu > Audit > Subscription Matching > Unmatched Products*

Selecting the *Main Menu* > *Subscription Matching* > *Unmatched Products* tab provides an overview of all systems the matcher could not find in the database or which were not registered with Uyuni. The <u>Unmatched Products</u> overview contains product names and the number of systems which remain unmatched with known installed products.

| 🖽 Subscription Matching 🍳  | 35 Edit Virtual Host Managers |
|--|-------------------------------|
| Match data status  |                               |
| Match data is computed via a task schedule, nightly by default (you can change the task schedule from the administration page).<br>No match data is currently available.<br>You can also trigger a first run now by clicking the button below. |                               |
| 2 Refresh matching data  |                               |
|  |                               |

#### FIGURE 13.2: UNMATCHED PRODUCTS

#### Show System List

Select to open and display a list of all systems which were detected with an installed product but remain unmatched with a subscription.

#### Main Menu > Audit > Subscription Matching > Pins 13.2.4

The subscription pinning feature allows a user to instruct the subscription matcher to favor matching a specific subscription with a given system or group of systems. This is achieved by creating pins. Each pin contains information about the preferred subscription-system match.

| 🖽 Subscription Matching °  | 🖄 Edit Virtual Host Managers |
|--|------------------------------|
| Match data status<br>Match data is computed via a task schedule, nightly by default (you can change the task schedule from the administration page).<br>No match data is currently available.<br>You can also trigger a first run now by clicking the button below.<br>Refresh matching data |                              |

## Note: Respecting Pins

In some cases the algorithm may determine that a specific pin cannot be respected, depending on the subscription's availability and applicability rules, in this case it will be shown as not satisfied.

The pins table displays a list of all pins. Items in the list contain the status of pins, which can be satisfied, not satisfied and pending next run.

- A pin is satisfied if its system and subscription was matched in the last matcher run.
- A pin is not satisfied if its system and subscription was not matched in the last matcher run. This can happen, for example, if the pin violates terms and conditions for subscriptions.
- A pin is in the pending next run state when it needs a new matcher run to be taken into account. After the new run, the pin will become either satisfied or not satisfied.

| + Add a Pin  |   |                                     |              |             |                 |                     |
| latch data status  | 8   |                                     |              |             |                 |                     |
|  | c<br>task schedule, nightly by default (you can change the task schedule from the administra  | ation page).                        |              |             |                 |                     |

Click the *Add a Pin* button to open the <u>Available Systems</u> window. You may filter systems by name and select a system for the matcher to pin manually.

| ep 1/2: select the system to p | in from the table below. |                               |                    |
|--------------------------------|--------------------------|-------------------------------|--------------------|
| Filter by name                 | Ite                      | ems 1 - 5 of 232              | 5 • items per page |
| System 🛓                       | Socket/IFL count         | Products                      |                    |
| Linux-QA1                      | 1                        | SUSE Manager Mgmt Single 1.2, | Select 🗲           |
| Linux-QA2                      | 1                        | SUSE Manager Mgmt Single 1.2, | Select 🗲           |
| Linux-QA3                      | 1                        |                               | Select >           |
| Linux-QA4                      | 2                        | SUSE Manager Mgmt Single 1.2, | Select 🗲           |
| Linux-Marketing1               | 2                        | SUSE Manager Mgmt Single 1.2, | Select 🗲           |

Within the Subscriptions Available for Selected System > ] window click the menu:Save Pin[ button to raise priority for subscription use on the selected system.

## 13.2.5 Main Menu > Audit > Subscription Matching > Messages

You can review all messages related to <u>Subscription Matching</u> from the *Main Menu > Audit > Subscription Matching > Messages* overview. The following status messages can be displayed.

**Unknown Part Number** 

Unsupported part number detected

#### **Physical Guest**

Physical system is reported as virtual guest, check hardware data

#### Guest with Unknown Host

Virtual guest has unknown host, assuming it is a physical system

#### Unknown CPU Count

System has an unknown number of sockets, assuming 16. You can try fixing this by scheduling hardware refresh for affected system.

| 巴 Subscription Matching <sup>0</sup>   | 3. Edit Virtual Host Managers |
|--|-------------------------------|
| Match data status<br>Match data is computed via a task schedule, nightly by default (you can change the task schedule from the administration page).<br>No match data is currently available.<br>You can also trigger a first run now by clicking the button below.<br>C Refresh matching data |                               |

## 13.3 OpenSCAP

If you click *Main Menu > Audit > OpenSCAP > All Scans*, an overview of the OpenSCAP Scans appears. SCAP (Security Content Automation Protocol) is a framework to maintain the security of enterprise systems. It mainly performs the following tasks:

- Automatically verifying the availability of patches
- Checking system security configuration settings
- Examining systems for signs of compromise

For a description of the Web UI dialogs, see Section 14.5, "OpenSCAP Uyuni Web Interface".

For instructions and tips on how to best use OpenSCAP with Uyuni, refer to *Chapter 14, System Security via OpenSCAP*. To learn more about OpenSCAP, see the project home page at http://open-scap.org ⊿.

## 14 System Security via OpenSCAP

The Security Certification and Authorization Package (SCAP) is a standardized compliance checking solution for enterprise-level Linux infrastructures. It is a line of specifications maintained by the National Institute of Standards and Technology (NIST) for maintaining system security for enterprise systems.

Uyuni uses OpenSCAP to implement the SCAP specifications. OpenSCAP is an auditing tool that utilizes the Extensible Configuration Checklist Description Format (XCCDF). XCCDF is a standard way of expressing checklist content and defines security checklists. It also combines with other specifications such as Common Platform Enumeration (CPE), Common Configuration Enumeration (CCE), and Open Vulnerability and Assessment Language (OVAL), to create a SCAPexpressed checklist that can be processed by SCAP-validated products.

## 14.1 OpenSCAP Features

OpenSCAP verifies the presence of patches by using content produced by the SUSE Security Team (https://www.suse.com/support/security/ ӣ), checks system security configuration settings and examines systems for signs of compromise by using rules based on standards and specifications. To effectively use OpenSCAP, the following must be available:

### A tool to verify a system confirms to a standard

Uyuni uses OpenSCAP as an auditing feature. It allows you to schedule and view compliance scans for any system.

#### SCAP content

SCAP content files defining the test rules can be created from scratch if you understand at least XCCDF or OVAL. XCCDF content is also frequently published online under open source licenses and this content can be customized to suit your needs.

The <u>openscap-content</u> package provides default content guidance for systems via a template.

## Note

SUSE supports the use of templates to evaluate your systems. However, you are creating custom content at your own risk.

SCAP was created to provide a standardized approach to maintaining system security, and the standards that are used will therefore continually change to meet the needs of the community and enterprise businesses. New specifications are governed by NIST's SCAP Release cycle in order to provide a consistent and repeatable revision work flow. For more information, see http://scap.nist.gov/timeline.html 2.

## 14.2 Prerequisites for Using OpenSCAP in Uyuni

The following sections describe the server and client prerequisites for using OpenSCAP.

#### Package Requirements

As Server: Uyuni 1.7 or later.

For the Client: spacewalk-oscap package (available from the Uyuni Tools Child Channel).

#### **Other Requirements**

Client: Distribution of the XCCDF content to all client machines.

## Note: OpenSCAP Auditing Availability

OpenSCAP auditing is not available on Salt SSH minions.

You can distribute XCCDF content to client machines using any of the following methods:

- Traditional Methods (CD, USB, NFS, scp, ftp)
- Uyuni Scripts
- RPMs

Custom RPMs are the recommended way to distribute SCAP content to other machines. RPM packages can be signed and verified to ensure their integrity. Installation, removal, and verification of RPM packages can be managed from the user interface.

## 14.3 Performing Audit Scans

OpenSCAP integration in Uyuni provides the ability to perform audit scans on client systems. This section describes the available scanning methods.

## Important: OpenSCAP Scans via Salt ssh-push Minions

Currently performing an OpenSCAP scan is disabled in the WebUI for Salt ssh-push minions. This functionality will be adapted and enabled in a future release.

PROCEDURE: SCANS VIA THE WEB INTERFACE

- 1. To perform a scan via the Web interface, log in to Uyuni .
- 2. Click on Systems and select the target system.
- 3. Click on *Audit* > *Schedule* .
- 4. Fill in the Schedule New XCCDF Scan form. See *Section 14.5.2.3, "Schedule Page"* for more information about the fields on this page.

## Warning

The XCCDF content is validated before it is run on the remote system. Specifying invalid arguments can make spacewalk-oscap fail to validate or run. Due to security concerns the oscap xccdf eval command only accepts a limited set of parameters.

Run the mgr\_check command to ensure the action is being picked up by the client system.

## Note

If the Uyuni daemon (<u>rhnsd</u>) or <u>osad</u> are running on the client system, the action will be picked up by these services. To check if they are running, use:

service rhnsd start

or

service osad start

+

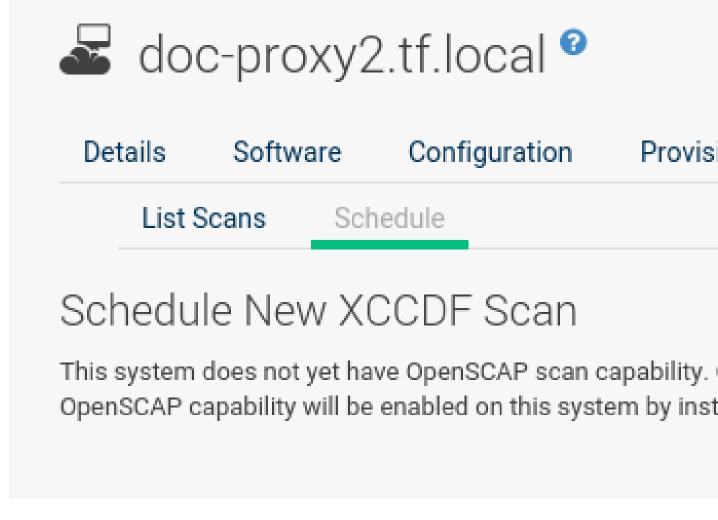

FIGURE 14.1: SCHEDULING A SCAN VIA THE WEB INTERFACE

#### PROCEDURE: SCANS VIA API

1. To perform an audit scan via API, choose an existing script or create a script for scheduling a system scan through system.scap.scheduleXccdfScan, the front end API, for example:

Where: <u>1000010001</u> is the system ID (sid). <u>/usr/local/share/scap/us-gcb-sled11desktop-xccdf.xml</u> is the path to the content location on the client system. In this case, it assumes USGCB content in the <u>/usr/local/share/scap</u> directory. \*\* <u>--</u>profile united\_states\_government\_configuration\_baseline is an additional argument for the oscap command. In this case, it is using the USGCB.

- 2. Run the script on the command-line interface of any system. The system needs the appropriate Python and XML-RPC libraries installed.
- 3. Run the <u>mgr\_check</u> command to ensure that the action is being picked up by the client system.

mgr\_check -vv

If the Uyuni daemon (<u>rhnsd</u>) or <u>osad</u> are running on the client system, the action will be picked up by these services. To check if they are running, use:

service rhnsd start

or

service osad start

## Note: Enabling Upload of Detailed SCAP Files

To make sure detailed information about the scan will be available, activate the upload of detailed SCAP files on the clients to be evaluated. On the *Admin > ] page > click on menu:Organization[* and select one. Click on the *Configuration > ] tab and check menu:Enable Upload Of Detailed SCAP Files[*. This feature generates an additional HTML version when you run a scan. The results will show an extra line like: <u>Detailed Results: xc-</u>cdf-report.html xccdf-results.xml scap-yast2sec-oval.xml.result.xml.

## 14.4 Viewing SCAP Results

There are three methods of viewing the results of finished scans:

- Via the Web interface. Once the scan has finished, the results should show up on the *Audit* tab of a specific system. This page is discussed in *Section 14.5, "OpenSCAP Uyuni Web Interface"*.
- Via the API functions in handler system.scap.
- Via the spacewalk-report command as follows:

```
spacewalk-report system-history-scap
spacewalk-report scap-scan
spacewalk-report scap-scan-results
```

## 14.5 OpenSCAP Uyuni Web Interface

The following sections describe the tabs in the Uyuni Web UI that provide access to OpenSCAP and its features.

## 14.5.1 OpenSCAP Scans Page

Click the *Audit* tab on the top navigation bar, then OpenSCAP on the left. Here you can view, search for, and compare completed OpenSCAP scans.

### 14.5.1.1 OpenSCAP > ] > menu:All Scans[

All Scans > ] is the default page that appears on the menu:Audit[OpenSCAP page. Here you see all the completed OpenSCAP scans you have permission to view. Permissions for scans are derived from system permissions.

For each scan, the following information is displayed:

#### System

the scanned system.

#### XCCDF Profile

the evaluated profile.

#### Completed

time of completion.

#### Satisfied

number of rules satisfied. A rule is considered to be satisfied if the result of the evaluation is either Pass or Fixed.

#### Dissatisfied

number of rules that were not satisfied. A rule is considered Dissatisfied if the result of the evaluation is a Fail.

#### Unknown

number of rules which failed to evaluate. A rule is considered to be Unknown if the result of the evaluation is an Error, Unknown or Not Checked.

The evaluation of XCCDF rules may also return status results like <u>Informational</u>, <u>Not Applicable</u>, or not <u>Selected</u>. In such cases, the given rule is not included in the statistics on this page. See *System Details* > *Audit* for information on these types of results.

### 14.5.1.2 OpenSCAP > ] > menu:XCCDF Diff[

XCCDF Diff is an application that visualizes the comparison of two XCCDF scans. It shows metadata for two scans as well as the lists of results.

Click the appropriate icon on the Scans page to access the diff output of similar scans. Alternatively, specify the ID of scans you want to compare.

Items that show up in only one of the compared scans are considered to be "varying". Varying items are always highlighted in beige. There are three possible comparison modes:

### Full Comparison

all the scanned items.

Only Changed Items

items that have changed.

### **Only Invariant**

unchanged or similar items.

### 14.5.1.3 OpenSCAP > ] > menu:Advanced Search[

Use the Advanced Search page to search through your scans according to specified criteria including:

- rule results,
- targeted machine,
- time frame of the scan.

# Q OpenSCAP Search <sup>2</sup>

### OpenSCAP Search will return finished OpenSCAP scans fro

| Specify your search criteria below. |               |
|-------------------------------------|---------------|
| Search XCCDF Rules For:             | Examples: 'no |
| With Result:                        | any           |
| Where to Search:                    | ⊙Search all   |
| Scan Dates to Search:               | 🗖 Search Sc   |
| Show Search Result As:              | ⊙List of XC   |
|                                     |               |

FIGURE 14.2: OPENSCAP ADVANCED SEARCH

The search either returns a list of results or a list of scans, which are included in the results.

### 14.5.2 Systems Audit Page

To display a system's audit page, click *Systems* > *system\_name* > *Audit* . Use this page to schedule and view compliance scans for a particular system. Scans are performed by the OpenSCAP tool, which implements NIST's standard Security Content Automation Protocol (SCAP). Before you scan a system, make sure that the SCAP content is prepared and all prerequisites in *Section 14.2*, *"Prerequisites for Using OpenSCAP in Uyuni"* are met.

#### 14.5.2.1 List Scans

This subtab lists a summary of all scans completed on the system. The following columns are displayed:

#### **XCCDF Test Result**

The scan test result name, which provides a link to the detailed results of the scan.

#### Completed

The exact time the scan finished.

#### Compliance

The unweighted pass/fail ratio of compliance based on the Standard used.

#### Ρ

Number of checks that passed.

#### F

Number of checks that failed.

#### Е

Number of errors that occurred during the scan.

#### U

Unknown.

#### Ν

Not applicable to the machine.

Κ

Not checked.

#### S

Not Selected.

#### I

Informational.

#### Х

Fixed.

#### Total

Total number of checks.

Each entry starts with an icon indicating the results of a comparison to a previous similar scan. The icons indicate the following:

- "RHN List Checked" Icon no difference between the compared scans.
- "RHN List Alert" Icon arbitrary differences between the compared scans.
- "RHN List Error" Icon major differences between the compared scans. Either there are more failures than the previous scan or less passes
- "RHN List Check In" Icon no comparable scan was found, therefore, no comparison was made.

To find out what has changed between two scans in more detail, select the ones you are interested in and click *Compare Selected Scans > ]*. *To delete scans that are no longer relevant > select those and click on menu:Remove Selected Scans[*. Scan results can also be downloaded in CSV format.

#### 14.5.2.2 Scan Details

The Scan Details page contains the results of a single scan. The page is divided into two sections:

#### Details of the XCCDF Scan

This section displays various details about the scan, including:

- File System Path: the path to the XCCDF file used for the scan.
- Command-line Arguments: any additional command-line arguments that were used.

- Profile Identifier: the profile identifier used for the scan.
- Profile Title: the title of the profile used for the scan.
- Scan's Error output: any errors encountered during the scan.

#### **XCCDF Rule Results**

The rule results provide the full list of XCCDF rule identifiers, identifying tags, and the result for each of these rule checks. This list can be filtered by a specific result.

#### 14.5.2.3 Schedule Page

Use the Schedule New XCCDF Scan page to schedule new scans for specific machines. Scans occur at the system's next scheduled check-in that occurs after the date and time specified. The following fields can be configured:

#### **Command-line Arguments**

Optional arguments to the oscap command, either:

• <u>--profile PROFILE</u>: Specifies a particular profile from the XCCDF document. Profiles are determined by the Profile tag in the XCCDF XML file. Use the <u>oscap</u> command to see a list of profiles within a given XCCDF file, for example:

```
# oscap info /usr/local/share/scap/dist_sles12_scap-sles12-oval.xml
Document type: XCCDF Checklist
Checklist version: 1.1
Status: draft
Generated: 2015-12-12
Imported: 2016-02-15T22:09:33
Resolved: false
Profiles: SLES12-Default
```

If not specified, the default profile is used. Some early versions of OpenSCAP in require that you use the --profile option or the scan will fail.

• <u>--skip-valid</u>: Do not validate input and output files. You can use this option to bypass the file validation process if you do not have well-formed XCCDF content.

#### Path to XCCDF Document

This is a required field. The path parameter points to the XCCDF content location on the client system. For example: <a href="mailto://usr/local/share/scap/dist\_sles12\_scap-sles12-oval.xml">/usr/local/share/scap/dist\_sles12\_scap-sles12-oval.xml</a>

The XCCDF content is validated before it is run on the remote system. Specifying invalid arguments can cause <u>spacewalk-oscap</u> to fail to validate or run. Due to security concerns, the <u>oscap xccdf eval</u> command only accepts a limited set of parameters.

For information about how to schedule scans using the Web UI, refer to *Procedure: Scans via* the Web Interface.

### 15 Configuration

Only Configuration Administrators or Uyuni Administrators see the Main Menu > Configuration pages.

On this configuration pages, manage systems with configuration files, channels offering configuration files, and configartion files themselves. Centrally-managed files are available to multiple systems; locally-managed files are available to individual systems only.

### Note: Differences of System Types

Configuration Managment is available for both client system types, traditionally managed clients ([Management]) and Salt minions ([Salt]). Some traditional features are not suitable for Salt minions, and thus not available and excluded from the Web UI.

#### Configuration Management for Salt 15.1

Configuration Management is now enabled for Salt. The following matrix provides both supported and unsupported configuration management features.

### Important: Missing Web UI Options

Several Web UI tabs will be missing for Salt Configuration Management. These features are not suitable for Salt minions.

| <b>Configuration Management Features</b> | Salt Support Status                                  |
|--|--|
| Global Configuration Channels            | Supported  |
| Deploying Files                          | Supported  |
| Comparing Files                          | Supported (but the logic is currently invert-<br>ed) |
| Locally Managed Files                    | Unsupported  |

#### TABLE 15.1: SALT CONFIGURATION MANAGEMENT

| <b>Configuration Management Features</b> | Salt Support Status  |
|--|--|
| Sandbox Files                            | Unsupported  |
| Applying the Highstate                   | Apply the highstate and configuration chan-<br>nels will be deployed to all subscribed sys-<br>tems. |
| File Import from a Client                | Unsupported  |
| Configuration Macros                     | Unsupported  |

## 15.2 Preparing Systems for Configuration Management [Management]

To manage a traditional client's configuration with Uyuni, it must have the appropriate tools and the <u>config-enable</u> file installed. These tools will be available if you installed the system with the configuration management functionality using AutoYaST or Kickstart. If not, they can be found in the Tools child channel for your distribution. Download and install the latest <u>rhncfg\*</u> packages:

- rhncfg the base libraries and functions needed by all rhncfg-\* packages,
- rhncfg-actions the RPM package required to run configuration actions scheduled via
  Uyuni,
- rhncfg-client the RPM package with a command line interface to the client features
  of the Configuration Management system,
- rhncfg-management the RPM package with a command line interface used to manage
  Uyuni configuration.

Installation of these packages can also be accomplished during bootstrapping if you enable <u>Con-</u><u>figuration File Deployment</u> on the <u>Details</u> page of the activation key after creating that activation key. For more information about activation keys, see *Section 7.9.1, "Managing Activation Keys"*.

### 15.3 Overview

The <u>Configuration Overview</u> page shows all of the configuration files that are managed by your organization in Uyuni.

| Configuration Summary  |  | Configuration Actions View Systems with Managed Configuration Files View All Managed Configuration Files |   |  |  |
|--|--|--|---|--|--|
| ystems with Managed Configuration Files: 0 s                             | ystems   |  |   |  |  |
| onfiguration Channels: 2 channels  |  |  |   |  |  |
| ntrally-managed Configuration Files: 14 files                            |  | View All Managed Configuration Channels  |   |  |  |
| cally-managed Configuration Files: 0 files                               |  | Create a New Configuration Channel   |   |  |  |
|  |  | Enable Configuration Management  | t on Systems  |  |  |
| Recently Modified Configuration Files                                    | Configuration Cł   | hannel   | 1 - 5 of<br>Modified                                  |  |  |

| Filename  /etc/jabberd/sm.xml  /etc/jabberd/sm.xml  /etc/jabberd/c2s.xml | ₩ rhn_proxy_cc<br>₩ rhn_proxy_cc<br>₩ rhn_proxy_cc<br>₩ rhn_proxy_cc | onfig_1000010004<br>onfig_1000010005<br>onfig_1000010004   | Modified<br>4 hours ago<br>4 hours ago<br>4 hours ago |  |  |

This list includes files that are managed centrally in configuration channels and files that are managed locally via individual system profiles.

#### **Configuration Summary**

The panel provides quick information about your configuration files. Click the blue text to the right to display relevant systems, channel details, or configuration files.

#### **Configuration Actions**

<u>Configuration Actions</u> offers direct access to the most common configuration management tasks. Deploy, compare, or create files on your systems.

#### **Recently Modified Configuration Files**

The list shows which files have changed when and to which channel they belong. If no files have been changed, no list appears. Click the name of a file to see its <u>Details</u> page. Click the channel name to see its Channel Details page.

File types that can appear here: \* • • • • • Centrally-managed configuration file provided by a global configuration channel. \* • • - [Management] Locally-managed configuration file, maybe overriding a centrally-managed file. \* • - [Management] Sandbox configuration file.

#### **Recently Scheduled Configuration File Deployments**

Each scheduled action is listed along with the status of the action. Any scheduled configuration task, from enabling configuration management on a system to deploying a specific configuration file, is displayed. Here you can quickly assess if all tasks have been successfully carried out or fix any problems. Clicking the blue text displays the *System Details* > *Schedule* page for the specified system.

### 15.4 Configuration Channels

As mentioned above, Uyuni manages both central and local configuration channels and files. Central configuration management allows you to deploy configuration files to multiple systems (both traditional clients ([Management]) and Salt minions ([Salt])). Local configuration management is available for traditional clients ([Management]) only and allows you to specify overrides or configuration files that are not changed by subscribing the system to a central channel. A "state channel" is a type of a configuration channel but for Salt minion only. For a state channel, the <u>init.sls</u> file is not auto-generated, the user creates and edits it. Additionally, state channels can contain arbitrary configuration files that could be referenced from within the init.sls file. Therefore, state channels effectively replace custom states.

## Note: Referencing Configuration Files with Organization ID

You must reference configuration files with the <u>salt://</u> prefix, the organization ID, and the channel name. For example, to reference /etc/motd use:

file.managed: - source: salt://manager\_org\_1/`channel\_name`/etc/motd

Central configuration or state channels must be created via the links on this page.

Click the name of the configuration channel to see the details page for that channel. If you click the number of files in the channel, you are taken to the <u>List/Remove Files</u> page of that channel. If you click the number of systems subscribed to the configuration channel, you are taken to the *Configuration Channel Details > Systems > Subscribed Systems* page for that channel.

To create a new central configuration channel:

PROCEDURE: CREATING CENTRAL CONFIGURATION CHANNEL

- 1. Click the Create Config Channel link in the upper right corner of this screen.
- 2. Enter a name for the channel.
- 3. Enter a label for the channel. This field must contain only letters, numbers, hyphens (\_) and underscores (\_).
- 4. Enter a mandatory description for the channel that allows you to distinguish it from other channels. No character restrictions apply.
- 5. Click the *Create Config Channel* button to create the new channel.
- 6. The following page is a subset of the <u>Channel Details</u> page and has three tabs: <u>Overview</u>, <u>Add Files</u>, and <u>Systems</u>. The <u>Channel Details</u> page is discussed in *Section 15.4.1*, *"Main Menu > Configuration > Configuration Channels > Configuration Channel Details"*.

To create a new state channel with an init.sls file:

PROCEDURE: CREATING STATE CHANNEL [SALT]

- 1. Click the Create State Channel link in the upper right corner of this screen.
- 2. Enter a name for the channel.
- 3. Enter a label for the channel. This field must contain only letters, numbers, hyphens (\_) and underscores (\_).
- 4. Enter a mandatory description for the channel that allows you to distinguish it from other channels. No character restrictions apply.
- 5. Enter the SLS Contents for the init.sls file.

- 6. Click the *Create Config Channel* button to create the new channel.
- 7. The following page is a subset of the <u>Channel Details</u> page and has four tabs: <u>Overview</u>, <u>List/Remove Files</u>, <u>Add Files</u>, and <u>Systems</u>. The <u>Channel Details</u> page is discussed in Section 15.4.1, "Main Menu > Configuration > Configuration Channels > Configuration Channel Details".

### 15.4.1 *Main Menu > Configuration > Configuration Channels > Configuration Channel Details*

#### Overview

The <u>Overview</u> page of the <u>Configuration Channel Details</u> page is divided into several panels.

#### **Channel Information**

The panel provides status information for the contents of the channel.

#### **Configuration Actions**

The panel provides access to the most common configuration tasks. For Salt minions, there is a link to edit the init.sls file.

#### **Channel Properties [Management]**

By clicking the <u>Edit Properties</u> link, you can edit the name, label, and description of the channel.

#### List/Remove Files

This page only appears if there are files in the configuration channel. You can remove files or copy the latest versions into a set of local overrides or into other central configuration channels. Check the box next to files you want to manipulate and click the respective action button.

#### Add Files

The <u>Add Files</u> page has three subtabs of its own, which allow you to <u>Upload</u>, <u>Import</u>, or Create configuration files to be included in the channel.

#### **Upload File**

To upload a file into the configuration channel, browse for the file on your local system, populate all fields, and click the *Upload Configuration File* button. The File-name/Path field is the absolute path where the file will be deployed.

You can set the <u>Ownership</u> via the <u>user name</u> and <u>group name</u> and the <u>Permis</u>sions of the file when it is deployed.

If the client has SELinux enabled, you can configure <u>SELinux contexts</u> to enable the required file attributes (such as user, role, and file type).

If the configuration file includes a macro (a variable in a configuration file), enter the symbol that marks the beginning and end of the macro. For more information on using macros, see *Section 15.5.2.1, "Including Macros in your Configuration Files"*.

**Import Files** 

To import files from other configuration channels, including any locally-managed channels, check the box to the left of any file you want to import. Then click the *Import Configuration File(s)* button.

A sandbox icon ( ) indicates that the listed file is currently located in a local sandbox. Files in a system's sandbox are considered experimental and could be unstable. Use caution when selecting them for a central configuration channel.

#### **Create File**

Create a configuration file, directory, or symbolic link from scratch to be included in the configuration channel.

#### PROCEDURE: CREATING A CONFIGURATION FILE, DIRECTORY, OR SYMBOLIC LINK FROM SCRATCH

- i. Choose whether you want to create a text file, directory, or symbolic link in the File Type section.
- ii. In the <u>Filename/Path</u> text box, set the absolute path to where the file should be deployed.
- iii. If you are creating a symbolic link, indicate the target file and path in the <u>Symbolic</u> Link Target Filename/Path text box.
- iv. Enter the <u>User name</u> and <u>Group name</u> for the file in the <u>Ownership</u> section, and the File Permissions Mode.
- v. If the client has SELinux enabled, you can configure <u>SELinux contexts</u> to enable the required file attributes (such as user, role, and file type).

- vi. If the configuration file includes a macro, enter the symbol that marks the beginning and end of the macro.
- vii. Then enter the configuration file content in the <u>File Contents</u> field, using the script drop-down box to choose the appropriate scripting language.
- viii. Click the Create Configuration File button to create the new file.

#### **Deploy Files**

This page only appears when there are files in the channel and a system is subscribed to the channel. Deploy all files by clicking the *Deploy All Files* button or check selected files and click the *Deploy Selected Files* button. Select to which systems the file(s) should be applied. All systems subscribed to this channel are listed. If you want to apply the file to a different system, subscribe it to the channel first. To deploy the files, click *Confirm & Deploy to Selected Systems*.

#### Systems

Manage systems subscribed to the configuration channel via two subtabs:

#### Subscribed Systems

All systems subscribed to the current channel are displayed. Click the name of a system to see the System Details page.

#### **Target Systems**

This subtab displays a list of systems enabled for configuration management but not yet subscribed to the channel. To add a system to the configuration channel, check the box to the left of the system's name and click the *Subscribe System* button.

### 15.5 Configuration Files

This page allows you to manage your configuration files independently. Both centrally-managed and locally-managed files can be reached from sub-pages.

### Note: Maximum Size for Configuration Files

By default, the maximum file size for configuration files is 128 KB (131072 bytes). SUSE supports a configuration file size up to 1 MB; larger values are not guaranteed to work.

To change the file size limit, edit all the following files on the Uyuni server and edit or add the following variables:

```
# /usr/share/rhn/config-defaults/rhn_web.conf
web.maximum_config_file_size = 262144
# /usr/share/rhn/config-defaults/rhn_server.conf
maximum_config_file_size = 262144
# /etc/rhn/rhn.conf
web.maximum_config_file_size=262144
server.maximum_config_file_size=262144
```

#### Then restart spacewalk:

# spacewalk-service restart

### 15.5.1 *Main Menu > Configuration > Configuration Files > Centrally-Managed Files*

Centrally-managed files are available to multiple systems. Changing a file within a centrally-managed channel may result in changes to several systems. Locally-managed files supersede centrally-managed files. For more information about locally-managed files, see *Section 15.5.2*, *"Main Menu > Configuration > Configuration Files > Locally-Managed Files [Management]"*.

This page lists all files currently stored in your central configuration channel. Click the <u>Path</u> of a file to see its <u>Details</u> tab. Click the name of the <u>Configuration Channel</u> to see the channel's <u>Overview</u> tab. Clicking <u>Systems Subscribed</u> shows you all systems currently subscribed to the channel containing that file. Click <u>Systems Overriding</u> to see all systems that have a local (or override) version of the configuration file. The centrally-managed file will not be deployed to those systems.

### 15.5.2 *Main Menu > Configuration > Configuration Files > Locally-Managed Files* [Management]

Locally-managed configuration files apply to only one system. They may be files in the system's sandbox or files that can be deployed to the system at any time. Local files have higher priority than centrally-managed files. If a system is subscribed to a configuration channel with a given file and additionally has a locally-managed version of that file, the locally-managed version will be deployed.

The list of all local (override) configuration files for your systems includes the local configuration channels and the sandbox channel for each Provisioning-entitled system.

Click the <u>Path</u> of the file to see its <u>Config</u> File <u>Details</u>. Click the name of the system to which it belongs to see its *System Details* > *Configuration* > *Overview* page.

#### 15.5.2.1 Including Macros in your Configuration Files

Being able to store one file and share identical configurations is useful, but what if you have many variations of the same configuration file? What do you do if you have configuration files that differ only in system-specific details, such as host name and MAC address?

Traditional file management would require to upload and distribute each file separately, even if the distinction is nominal and the number of variations is in the hundreds or thousands. Uyuni addresses this by allowing the inclusion of macros, or variables, within the configuration files it manages. In addition to variables for custom system information, the following standard macros are supported:

```
rhn.system.sid
rhn.system.profile_name
rhn.system.description
rhn.system.hostname
rhn.system.ip_address
rhn.system.custom_info(key_name)
rhn.system.net_interface.ip_address(eth_device)
rhn.system.net_interface.netmask(eth_device)
rhn.system.net_interface.broadcast(eth_device)
rhn.system.net_interface.hardware_address(eth_device)
rhn.system.net_interface.driver_module(eth_device)
```

To use this powerful feature, either upload or create a configuration file via the <u>Configuration</u> <u>Channel Details</u> page. Then open its <u>Configuration File Details</u> page and include the supported macros of your choice. Ensure that the delimiters used to offset your variables match those set in the <u>Macro Start Delimiter</u> and <u>Macro End Delimiter</u> fields and do not conflict with other characters in the file. We recommend that the delimiters be two characters in length and must not contain the percent (%) symbol.

For example, you may have a file applicable to all of your servers that differs only in IP address and host name. Rather than manage a separate configuration file for each server, you may create a single file, such as server.conf, with the IP address and host name macros included.

```
hostname={| rhn.system.hostname |}
ip_address={| rhn.system.net_interface.ip_address(eth0) |}
```

Upon delivery of the file to individual systems, whether through a scheduled action in the Uyuni Web interface or at the command line with the Uyuni Configuration Client (<u>mgrcfg-client</u>), the variables will be replaced with the host name and IP address of the system as recorded in Uyuni's system profile. In the above example configuration file the deployed version resembles the following:

```
hostname=test.example.domain.com
ip_address=177.18.54.7
```

To capture custom system information, insert the key label into the custom information macro (<u>rhn.system.custom\_info</u>). For example, if you developed a key labeled "`asset`" you can add it to the custom information macro in a configuration file to have the value substituted on any system containing it. The macro would look like this:

```
asset={@ rhn.system.custom_info(asset) @}
```

When the file is deployed to a system containing a value for that key, the macro gets translated, resulting in a string similar to the following:

asset=Example#456

To include a default value, for example, if one is required to prevent errors, you can append it to the custom information macro, like this:

asset={@ rhn.system.custom\_info(asset) = 'Asset #' @}

This default is overridden by the value on any system containing it.

Using the Uyuni Configuration Manager (<u>mgrcfg-manager</u>) will not translate or alter files, as this tool is system agnostic. <u>mgrcfg-manager</u> does not depend on system settings. Binary files cannot be interpolated.

### 15.6 Systems

This page displays status information about your system in relation to configuration. There are two sub-pages: Managed Systems and Target Systems.

### 15.6.1 Main Menu > Configuration > Systems > Managed Systems

By default the <u>Managed Systems</u> page is displayed. The listed systems have been fully prepared for configuration file deployment. The number of locally- and centrally-managed files is displayed. Clicking the name of a system shows its *System Details* > *Configuration* > *Overview* page. Clicking the number of local files takes you to the *System Details* > *Configuration* > *View/Modify Files* > *Locally-Managed Files* page, where you manage which local (override) files apply to the system. Clicking the number of centrally-managed files takes you to the *System Details* > *Configuration* > *Manage Configuration Channels* > *List/Unsubscribe from Channels* page. Here you unsubscribe from any channels you want.

### 15.6.2 Main Menu > Configuration > Systems > Target Systems

Here you see the systems either not prepared for configuration file deployment or not yet subscribed to a configuration channel. The table has three columns. The first identifies the system name, the second shows whether the system is prepared for configuration file deployment, and the third lists the steps necessary to prepare the system. To prepare a system, check the box to the left of the profile name then click the *Enable SUSE Manager Configuration Management* button. All of the preparatory steps that can be automatically performed are scheduled by Uyuni.

### Note

You will need to perform some manual tasks to enable configuration file deployment. Follow the on-screen instructions provided to assist with each step.

### 16 Schedule

Main Menu > Schedule helps with managing actions and combining actions to action chains.

*Main Menu > Schedule* features pages that enable you to manage the actions carried out on your systems. An action is a scheduled task to be performed on one or more client systems. For example, an action can be scheduled to apply all patches to a system. Actions can also be grouped into action chains to schedule them at the same time in a particular order, for example to reboot a system after deploying patches.

Uyuni keeps track of the following action types:

- package alteration (installation, upgrade, and removal),
- rollback package actions,
- system reboots,
- patch application,
- configuration file alteration (deploy, upload, and diff),
- hardware profile updates,
- package list profile updates,
- automated installation initiation,
- service pack migrations,
- remote commands.

Each page in the Main Menu > Schedule category represents an action status.

### 16.1 Pending Actions

The *Pending Actions* > ] page appears when clicking menu: Main Menu[Schedule > Pending Actions. It displays actions not yet started or still in progress.

| 9 Pend   | ling Actions <sup>©</sup>                  |  |                           |                           |                        |  |  |
|--|--|--|---------------------------|---------------------------|------------------------|--|--|
| The following actions have been scheduled, and are awaiting execution by one or more systems. Actions can only be archived by Org Admins or by the user who so action. |  |  |                           |                           |                        |  |  |
| lote: For multi-<br>n Total.   | system scheduled actions, the ability to c | ancel individual systems means that th | e number of clients menti | oned in the Action column | may not match the numb |  |  |
|  | Scheduled Time                             | Succeeded                              | Failed                    | Pending                   | Total                  |  |  |
| Action   |  |  |                           |                           |                        |  |  |

To cancel an action, select the action, and click Cancel Actions, then Confirm.

### 16.2 Failed Actions

Sometimes actions cannot be completed. If the action returns an error, it is displayed here.

| O Failed Actions <sup>0</sup>  |                         |           |        |           |             |
|--|-------------------------|-----------|--------|-----------|-------------|
| The following actions have failed to execute properly on one or mc<br>vote: For multi-system scheduled actions, the ability to cancel indi<br>n Total. |                         |           |        |           |             |
| Select All 1 - 2 of 2 (0 selected)   |                         |           |        | Arch      | ive Actions |
| Filter by Action:  |                         |           |        | 25 🔽 iter | ms per page |
| □ Action   | Scheduled Time 17       | Succeeded | Failed | Pending   | Total       |

### 16.4 Archived Actions

If you selected actions to store for review, they are displayed here and can be deleted.

| <ol> <li>Arch</li> </ol>    | nived Actions 🕫                            |   |                           |                           |                          |
|-----------------------------|--|---|---------------------------|---------------------------|--------------------------|
| The following               | actions have been archived.                |   |                           |                           |                          |
| Note: For mult<br>in Total. | i-system scheduled actions, the ability to | cancel individual systems means that th | e number of clients menti | oned in the Action column | n may not match the numb |
|                             |  |   |                           |                           | Delete Actions           |
| Action                      | Scheduled Time                             | Succeeded                               | Failed                    | Pending                   | Total                    |
| No archived a               | actions.                                   |   |                           |                           |                          |
|                             |  |   |                           |                           |                          |

### 16.5 Action Chains

You can create action chains-or grouped actions-for example, in the *Main Menu* > *Software* > *Packages* ages or *Software* > *Packages* subtabs on a system details page (see *Section 7.3.2.1, "System Details* > *Software* > *Patches"* or *Section 7.3.2.2, "System Details* > *Software* > *Packages"*) or in the *Configuration* > *Deploy Files* subtab on a system details page (see *Section 7.3.3.4, "System Details* > *Configuration* > *Deploy Files"*).

The following list of actions may be added to an action chain. These actions are supported on both traditional clients and Salt minions. Schedulable actions are located under a systems, System Details page on the following subtabs.

#### CHAINABLE ACTIONS

- System Details > Remote Command
- System Details > Schedule System Reboot
- System Details > States > Highstate
- System Details > Software > Packages > List/Remove
- System Details > Software > Packages > Install
- System Details > Software > Packages > Upgrade
- System Details > Software > Patches
- System Details > Software > Software Channels
- System Details > Configuration
- Main Menu > Images > Build

| 🗞 Action Cł                  | nain List 🤨  |  |
|------------------------------|--|--|
| Below is a list of all Actio | on Chains available to the current user.   | Click on a label to view or edit it.   |
|                              | tion Chain by scheduling any supporten<br>nager and single system actions are su | d operation, such as installing or upgrading a package, running a remote command or deploying a configuration<br>upported. |
| Label                        | Last modified  | Total Action Count   |
| No Action Chains foun        | d.   |  |
|                              |  |  |

In the <u>Action Chain List</u> you can click the label to view or edit an <u>Action Chain</u>. In the top right corner is the <u>delete action chain</u> link. To add actions to an existing chain, pick up a "chainable" action (such as running a remote command) from a system details page (see *Section 7.3, "System Details"*). Then check <u>Add to Action Chain</u> and select an action chain from the drop-down box. Confirm with *Schedule*.

To create a new action chain, configure the first action, then select Add to Action Chain instead of Schedule no sooner than. Click the drop-down box, enter a name, and click *Schedule* to save the chain. Then proceed to the next action and add it to the new chain.

Action chains can be edited via the *Main Menu* > *Schedule* > *Action Chains* page. Click a chain name to see the actions in the order they will be performed. The following tasks can be carried out here:

- Change the order of actions by dragging the respective action to the right position and dropping it.
- Delete actions from the chain by clicking the delete action link.

- Inspect the list of systems on which an action is run by clicking the + sign.
- Delete a single system from an action chain by clicking the delete system link.
- Delete the complete action chain with the delete action chain link in the top-left corner.
- Change an action chain label by clicking it.
- Schedule an action chain for execution on a certain date by clicking the Save and Schedule button.

### Note: Unsaved Changes

If you leave the page without clicking either Save or Save and Schedule all unsaved changes will be discarded. In this case, a confirmation dialog will pop up.

Currently you cannot add an action to an action chain from the Edit section of the action chain details page. When a Chain is scheduled, the actions it contains will be displayed under Schedule on the appropriate pages: Pending Actions, Failed Actions, or Completed Actions depending on the status. If one action fails on a system no other actions from the same chain will be executed on that systems. Because of technical limitations it is not possible to reuse Action Chains.

### 16.6 Actions List

On each action page, each row in the list represents a single scheduled event or action that might affect multiple systems and involve various packages. The list contains several columns of information:

- Filter by Action Enter a term to filter the listed actions or use the check boxes in this column to select actions. Then either add them to your selection list or archive them by clicking Archive Actions . If you archive a pending action, it is not canceled, but the action item moves from the Pending Actions list to the Archived Actions list.
- Action Type of action to perform such as Patches or Package Install. Clicking an action name shows its Action Details page. Refer to Section 16.7, "Action Details" for more information.

- Scheduled Time The earliest day and time the action will be performed.
- Succeeded Number of systems on which this action was successfully carried out.
- Failed Number of systems on which this action has been tried and failed.
- In Progress Number of systems on which this action is taking place.
- Total Total number of systems on which this action has been scheduled.

### 16.7 Action Details

If you click the name of an action, the <u>Action Details</u> page appears. This page is split into the following tabs.

#### 16.7.1 *Action Details > Details*

General information about the action. This is the first tab you see when you click an action. It displays the action type, scheduling administrator, earliest execution, and notes.

### Note: Patch Advisory

Clicking the Patch Advisory takes you to the <u>Patch Details</u> page. The Patch Advisory appears only if the action is a patch. Refer to *Section 11.2.2, "Patch Details"*. for more information.

### 16.7.2 Action Details > Completed Systems

List of systems on which the action has been successfully performed. Clicking a system name displays its System Details page. Refer to *Section 7.3, "System Details"*. for more information.

#### 16.7.3 Action Details > In Progress Systems

List of systems on which the action is now being carried out. To cancel an action, select the system by marking the appropriate check box and click the *Unschedule Action* button. Clicking a system name shows its <u>System Details</u> page. Refer to *Section 7.3, "System Details"*. for more information.

### 16.7.4 Action Details > Failed Systems

List of systems on which the action has failed. It can be rescheduled here. Clicking a system name takes you to its System Details page. Refer to Section 7.3, "System Details". for more information.

### 16.7.5 Action Details > Package List

List of packages are associated with this action. The tab appears only if the action is package related (installation, removal, etc.).

### 17 Users

Only Uyuni administrators can see *Main Menu* > *Users*. With <u>Users</u> you can grant and edit permissions for those who administer your system groups. Click a user name in the *Main Menu* > *Users* > *User List* > *Active* to modify the user.

To add new users to your organization, click the <u>Create User</u> link on the top right corner of the page. On the Create User page, fill in the required values for the new user.

Once all fields are completed, click the *Create Login* button. Uyuni now sends an e-mail to the specified address and takes you back to the *Main Menu* > *Users* > *User List* > *Active* page. If you want to set permissions and options for the new user, click the name in the list. The <u>User</u> Details page for this user provides several tabs of options.

Refer to Section 17.1.4, "User Details" for detailed descriptions of each tab.

### 17.1 User List

The User List provides three views:

- Active user list
- Deactivated user list
- List all users

#### 17.1.1 Main Menu > Users > User List > Active

The active user list shows all active users on your Uyuni and displays basic information about each user: user name, real name, roles, and date of their last sign in.

The active user list shows all active users on your Uyuni and displays basic information about each user: user name, real name, roles, and date of their last sign in.

Each row in the <u>User List</u> represents a user within your organization. There are four columns of information for each user:

- <u>Username</u> The login name of the user. Clicking a user name displays the <u>User Details</u> page for the user. Refer to *Section 17.1.4, "*User Details" for more information.
- Real Name The full name of the user (last name, first name).

- <u>Roles</u> List of the user's privileges, such as organization administrator, channel administrator and normal user. Users can have multiple roles.
- Last Sign In Shows when the user last logged in to Uyuni.

| 1 - 1 of 1    |                              |  |               |

### 17.1.2 Main Menu > Users > User List > Deactivated

The deactivated user list shows all deactivated users. You may also reactivate any user listed here.

| Deactiva             | ated Users 🕫 |       |              |                | + Create User    |
|----------------------|--------------|-------|--------------|----------------|------------------|
| Username             | Real Name    | Roles | Last Sign In | Deactivated By | Deactivated Date |
| No deactivated users | 3.           |       |              |                |                  |

Click the check box to the left of their name and click the *Reactivate* button then the *Confirm* button. Reactivated users retain the permissions and system group associations they had when they were deactivated. Clicking a user name shows the User Details page.

### 17.1.3 Main Menu > Users > User List > All

The <u>All</u> page lists all users that belong to your organization. The <u>All</u> page lists all users that belong to your organization.

| <b>u</b> ser | s Overview <sup>®</sup>      |  | +                      | Create User |
|--------------|------------------------------|--|------------------------|-------------|
| 1 - 1 of 1   |                              |  |                        |             |
| Filter by Us | ername:                      | Select first character +                               |                        |             |
| Username     | Real Name                    | Roles  | Last Sign In           | Status      |
| admin        | Administrator, Administrator | SUSE Manager Administrator, Organization Administrator | 6/5/18 6:02:06 PM CEST | Active      |

In addition to the fields listed in the previous two screens, the table of users includes a <u>Status</u> field. This field indicates whether the user is <u>Active</u> or <u>Deactivated</u>. Click a user name to see the <u>User Details</u> page.

### 17.1.4 User Details

Clicking a user name on a Main Menu > Users > User List listing displays the User Details page.

| 1 - 1 of 1     |                              |  |               |
|----------------|------------------------------|--|---------------|
| Filter by User | mame:                        | Select first character 👻                               |               |
| Jsername       | Real Name                    | Roles  | Last Sign In  |
| Idmin          | Administrator, Administrator | SUSE Manager Administrator, Organization Administrator | 6 minutes ago |

Here Uyuni administrators manage the permissions and activity of all the users. Here you can also delete or deactivate users.

Users can be deactivated directly in the Uyuni Web interface. Uyuni administrators can deactivate or delete users of their organization. Users can deactivate their own accounts.

### Note: Users with Uyuni Administrator Role

Users with the Uyuni administrator role cannot be deactivated until that role is removed from their account.

Deactivated users cannot log in to the Uyuni Web UI or schedule any actions. Actions scheduled by a user prior to their deactivation remain in the action queue. Deactivated users can be reactivated by Uyuni administrators.

### Warning: Irreversible Deletion

User deletion is irreversible; exercise it with caution. Consider deactivating the user first to assess the effect deletion will have on your infrastructure.

To deactivate a user:

- 1. Click a user name to navigate to the User Details tab.
- 2. Verify that the user is not a Uyuni administrator. If they are, uncheck the box to the left of that role and click the Submit button.
- 3. Click the Deactivate User link in the upper right corner of the dialog.
- 4. Click the *Deactivate User* button to confirm.

To delete a user:

- 1. Click a user name to navigate to the User Details tab.
- 2. Verify that the user is not a Uyuni administrator. Uncheck the box to remove the role if necessary.
- 3. Click the Delete User link in the upper right corner of the dialog.
- 4. Click the Delete User button to permanently delete the user.

For instructions to deactivate your own account, refer to Section 6.7.4, "Account Deactivation".

#### User Details > Details 17.1.4.1

The Details tab, displays the user name, first name, last name, e-mail address, roles of a user, and other details about the user. The Details tab, displays the user name, first name, last name, e-mail address, roles of a user, and other details about the user.

|   |  |                                   |

Edit this information as needed and then confirm with *Update*. When changing a user's password, you will only see asterisks as you type.

To delegate responsibilities within your organization, Uyuni provides several roles with varying degrees of access. This list describes the permissions of each role and the differences between them:

- [guimenu]``User (normal user) Also known as a *System Group User*, this is the standard role associated with any newly created user. This person may be granted access to manage system groups and software channels, if the Uyuni administrator sets the roles accordingly. The systems must be in system groups for which the user has permissions to manage them. However, all globally subscribable channels may be used by anyone.
- <u>SUSE Manager Administrator</u> This role allows a user to perform any function available in Uyuni.

As the master account for your organization, the person holding this role can alter the privileges of all other accounts of this organization, and conduct any of the tasks available to the other roles. Like with other roles, multiple Uyuni administrators may exist. Go to *Main Menu > Admin > Users* and click the check box in the <u>SUSE Manager Admin</u> row. For more information, see *Section 18.3, "Main Menu > Admin > Users"*.

+ A SUSE Manager Administrator can create foreign organizations; but a SUSE Manager Administrator can only create users for an organization if he is entitled with organization administrator privileges for this organization. \* Organization Administrator — This role provides a user with all the permissions other administrators have, namely the activation key, configuration, channel, and system group administrator. A Organization Administrator is not entitled to perform actions that belong to the Main Menu > Admin features (see Chapter 18, Admin). \* Activation Key Administrator — This role is designed to manage your collection of activation keys. A user assigned to this role can modify and delete any key within your organization. \* Image Administrator — This role is designed to manage Image building. Modifiable content includes Image Profiles, Image Builds and Image Stores. A user assigned with this role can modify and delete all content located under the Main Menu > Images. These changes will be applied across the organization. \* Configuration Administrator — This role enables a user to manage the configuration of systems within the organization, using either the Uyuni Web UI or tool from the rhncfg-management package. \* Channel Administrator — This role provides a user with full access to all software channels within your organization. This requires the Uyuni synchronization tool (mgr-sync from the susemanager-tools package). The channel administrator may change the base channels of systems, make channels globally subscribable, and create entirely new channels. \* System Group Administrator — This role limits authority to systems or system groups to which access is granted. The System Group Administrator can create new system groups, delete any assigned systems from groups, add systems to groups, and manage user access to groups.

Being a Uyuni administrator enables you to remove administrator rights from other users. It is possible to remove your own privileges as long as you are not the only Uyuni administrator.

To assign a new role to a user, check the respective box. Uyuni administrators are automatically granted administration access to all other roles, signified by grayed-out check boxes. Click *Update* to submit your changes.

#### 17.1.4.2 User Details > System Groups

This tab displays a list of system groups the user may administer; for more information about system groups, see *Section 7.4, "Systems > System Groups"*.

| 💄 adr          | nin 🤨         |                  |   |                    | 🖹 Delete User   🖨 Deactivate User   |

| user to have   |               | egistered syster |   |                    | n, that system will be assigned to the selected group or groups. This allows the<br>one or more of the groups the system is assigned to. System Groups to which |
|                |               |                  | Default System Groups   | :Your organization | n has no system groups.   |

Uyuni administrators can set this user's access permissions to each system group. Check or uncheck the box to the left of the system group and click the *Update Permissions* button to save the changes.

Uyuni administrators may select one or more default system groups for a user. When the user registers a system, it gets assigned to the selected group or groups. This allows the user to access the newly-registered system immediately. System groups to which this user has access are preceded by an (\*).

#### 17.1.4.3 User Details > Systems

This tab lists all systems a user can access according to the system groups assigned to the user.

|                             |                        |                | ۲                              |                       |                              |                                    |
| Permission                  | n Channel Name         |                | ۲                              |                       |                              |                                    |
| Permission                  | n Channel Name         |                | ۲                              |                       |                              | 1-1 of                             |

Grant explicit channel subscription permission to a user for each of the channels listed by checking the box to the left of the channel, then click the *Update Permissions* button. Permissions granted by a Uyuni administrator or channel administrator have no check box but a check icon like globally subscribable channels.

#### 17.1.4.4.1 User Details > Channel Permissions > Subscription

Identifies channels to which the user may subscribe systems.

To change these, select or deselect the appropriate check boxes and click the *Update Permissions* button. Note that channels subscribable because of the user's administrator status or the channel's global settings cannot be altered. They are identified with a check icon.

#### 17.1.4.4.2 User Details > Channel Permissions > Management

Identifies channels the user may manage. To change these, select or deselect the appropriate check boxes and click the *Update Permissions* button. The permission to manage channels does not enable the user to create new channels. Note that channels automatically manageable through the user's admin status cannot be altered. These channels are identified with a check icon. Remember, Uyuni administrators and channel administrators can subscribe to or manage any channel.

#### 17.1.4.5 User Details > Preferences

Configure the following preference settings for a user.

| 📥 admin 🍳   | 🗃 Delete User 🛛 🗢 Deactivate User |
|---|-----------------------------------|
| Details System Groups Systems Channel Permissions Preferences Addresses   |                                   |
| Email Notifications   |                                   |
| SUSE Manager offers email notifications for when patches relevant to your systems are released, as well as daily emails summarize<br>Receive email notifications<br>Receive taskomatic notifications  | ng the events for your systems.   |
| SUSE Manager List Page Size   |                                   |
| This controls how many entries, like systems, would be displayed per page in a list context. Show $25 	extsf{v}$ entries per list page  |                                   |
| "Overview" Start Page   |                                   |
| <ul> <li>Display the following information on my "Overview" page upon login:</li> <li>Tasks: A task-oriented menu of quick links to different areas of the SUSE Manager user interface.</li> <li>Most Critical Systems: A listing of the systems with the most critical update and health status.</li> <li>System Groups: Preview the overall status of your system groups.</li> <li>Relevant Security Errata: View the most recent security errata applicable to your systems.</li> <li>Inactive Systems: Lists the registered SUSE Manager systems that recently stopped checking in.</li> <li>Recently Scheduled Actions: Lists the scheduled actions of the user.</li> <li>Recently Registered Systems: A listing of the most recently registered systems within the past 30 days.</li> </ul> |                                   |
| Time Zone   |                                   |
| Dates and times, like system checkin times, will be shown according to the selected timezone. Display all times as (GMT+0100) Europe (Central)  |                                   |
| CSV Files   |                                   |
| Configure a separator character to be used in downloadable CSV files:<br>© Comma (",", default)<br>© Semicolon (",", compatible with Microsoft® Excel®)   |                                   |
| Save Preferences  |                                   |

- <u>Email Notifications</u> : Determine whether this user should receive e-mail every time a patch alert is applicable to one or more systems in his or her Uyuni account, and daily summaries of system events.
- <u>SUSE Manager List Page Size</u> : Maximum number of items that appear in a list on a single page. If the list contains more items than can be displayed on one page, click the *Next* button to see the next page. This preference applies to the user's view of system lists, patch lists, package lists, and so on.
- Overview Start Page : Configure which information to be displayed on the "Overview" page at login.

- <u>Time Zone</u> : Select the time zone from the drop-down box. Dates and times, like system check-in times, will be displayed according to the selected time zone.
- <u>CSV Files</u> : Select whether to use the default comma or a semicolon as separator in downloadable CSV files.

Change these options to fit your needs, then click the Save Preferences button.

#### 17.1.4.6 User Details > Addresses

This tab lists mailing addresses associated with the user's account.

| 🛔 adr                                    | nin º                 |                   |                     |             |           | 💼 Delete User  🗢 Deactivate User |
|--|-----------------------|-------------------|---------------------|-------------|-----------|----------------------------------|

| Fill in this a                           | address               |                   |                     |             |           |                                  |

If there is no address specified yet, click *Fill in this address* and fill out the form. When finished, click *Update*. To modify this information, click the *Edit this address* button, change the relevant information, and click the *Update* button.

### 17.2 System Group Configuration

System Groups help when diferrent users shall administer different groups of systems within one organization.

### 17.2.1 Main Menu > Users > System Group Configuration > Configuration

Enable Create a user default System Group and confirm with Update.

Assign such a group to systems via the *System Details > Groups > Join* subtab. For more information, see *Section 7.3.5.2, "System Details > Groups > Join"*.

| 📽 System Group Configuration °  |
|---|
| Configuration External Authentication   |
| When creating new users, a default System Group may be created for every single user, that would have the same name as the user. This is useful, when different users shall administer different groups of systems within one organization. |
| New user creation   |
| Create a user default System Group 🛛  |
| Update  |

### 17.2.2 *Main Menu > Users > System Group Configuration > External Authentication*

Allows to create an external group with the Create External Group link.

Users can join such groups via the <u>System Groups</u> of the user details page, then check the wanted Group, and confirm with *Update Permissions*.

| 🗳 System Group Co                                      | nfiguration - External Authentication  | + Create External Group             |

For more information, see Section 17.1.4.2, "User Details > System Groups".

# 18 Admin

The *Main Menu* > *Admin* pages allows Uyuni customers to manage the basic configuration, including creating and managing multiple organizations. Only the Uyuni administrator can access the *Main Menu* > *Admin* pages.

# 18.1 Main Menu > Admin > Setup Wizard

Setting up Uyuni typically requires some extra steps after installation for common configuration tasks.

The *Main Menu* > *Admin* > *Setup Wizard* link is displayed when the Uyuni Web UI is used for the fist time and can be accessed later at any time by clicking *Main Menu* > *Admin* > *Setup Wizard*. On the three tabs configure the HTTP proxy server, organization credentials, and SUSE products.

HTTP Proxy:

If needed configure a proxy server that Uyuni will use to access SCC (SUSE Customer Center) and other remote servers here. Use <u>hostname:port</u> syntax in the *HTTP Proxy* > *HTTP Proxy Hostname:* field if the proxy port is not 8080. Clearing the fields disables proxy.

| 🗱 Setup Wizard 🍳                    |                 |  |
|-------------------------------------|-----------------|--|
| HTTP Proxy Organization Credentials | SUSE Products   |  |
| HTTP Proxy Hostname:                | Hostname:Port   | SUSE: Manager  |
| HTTP Proxy Username:                | Usemame         |  |
| HTTP Proxy Password:                | Password        |  |
|                                     | Save and Verify |  |
|                                     |                 | HTTP Proxy   |
|                                     |                 | If this server uses an HTTP proxy to<br>access the outside network, you can<br>use this form to configure it. If that is<br>not the case simply click on Next. |
| Next 🗲 1 of 3                       |                 |  |

### Organization Credentials:

Select *Admin* > *Setup Wizard* > *Organization Credentials* > *Add a new credential* then enter user name and password to give another organization/user access to SUSE Customer Center.

| 📽 Setup Wizard 🎱                    |               |                      |   |
|-------------------------------------|---------------|----------------------|---|
| HTTP Proxy Organization Credentials | SUSE Products |                      |   |
| UC7                                 |               | 0                    | What are Organization<br>Credentials?<br>Organization credentials (Mirror<br>credentials) are your access to SUSE |
| S 🛧 🇮 🖋                             | Đ             | Add a new credential | product downloads.  |
|                                     |               |                      | 8<br>8  |
|                                     |               |                      | Where do I find my<br>Organization Credentials?   |
|                                     |               |                      | You can find them in the Customer Center.   |
| ← Prev Next → 2 of 3                |               |                      |   |
|                                     |               |                      |   |

After saving, a new credential card will be displayed. Buttons below the credential card allow you to:

- Check credential validation status (green tick or red cross icon). To re-check the credential with SCC, click the icon.
- Set the primary credentials for inter-server synchronization (yellow star icon).
- List the subscriptions related to a certain credential (list icon).
- Edit the credential (pencil icon).
- Delete the credential (trash can icon).

### Main Menu > Admin > SUSE Products

On the *Main Menu* > *Admin* > *SUSE Products* page, select product-specific channels you are entitled to.

|   |         | Clear + Add products | Refresh the product catalog   |
|---|---------|----------------------|---|

| Page 1 of 4   |         | First Prev Next Last |   |

The products displayed are directly linked to your organization credentials and your SUSE subscriptions. Product extension and module lists are shown when you click the *arrow* to the left of the product description. This is a cascading mechanism and allows to unfold several levels according to the integration of the extensions and modules in the base product.

Products based on SUSE Linux Enterprise 15 or higher have a toggle button named *include recommended*. When the toogle button is enabled on a base product, recommended extensions and modules are automatically selected for synchronization. Once the *include recom-mended* button is enabled, you may uncheck product child channels you are not interested in syncing. Recommended channels are labeled accordingly. You cannot disable required channels.

If you click the *Channels* icon in a row of a product, a popup lists the underlying channels (repositories) that build the product.

In the row above the product listing two filter options are available:

- Search by the product description. The filter limits the search to base products.
- Filter by architecture. Click in the search field (or press Enter ) and then select from drop-down menu. You can repeat this as often as necessary. To remove an architecture either click the "x" symbol (or press Backspace ).

Once you have made your selection(s), click *Add products* in the upper right area. This is equivalent to running <u>mgr-sync</u> add products or <u>mgr-sync</u> without any arguments.

View the synchronization progress in the status bar field to the right.

# Note: Synchronization Time

Channel synchronization will start and might take several hours. When finished the corresponding channels can be used in Uyuni.

# Important: If Synchronization Fails

SUSE does not automatically trust 3rd party GPG keys. If a reposync fails check if an untrusted GPG key is the cause by viewing the log files located in:

/var/log/rhn/reposync

Look for lines similar to the following:

```
['/usr/bin/spacewalk-repo-sync', '--channel', 'sle-12-sp1-ga-desktop-
nvidia-driver-x86_64', '--type', 'yum', '--non-interactive']
ChannelException: The GPG key for this repository is not part of the
keyring.
```

Alternatively, you can add listed channels immediately by clicking the *Add this prod-uct* button in the status column. A progress bar will be displayed. The main product will expand, and then you may select add-on products belonging to the product that is currently added. To overview required channels, select the list icon in the *SUSE Products* > *Channels* column. Once a product has finished downloading, the status bar state will change from a filled percentage value to *SUSE Products* > *Finished*.

# 18.2 Main Menu > Admin > Organizations

The organizations feature allows Uyuni administrators to create and manage multiple organizations across Uyuni. Administrators can control an organization's access to system management tasks.

| 🗳 Organizations 🕫       |   |         |       | + Create Organization |
|-------------------------|---|---------|-------|-----------------------|
| 1 - 1 of 1              |   |         |       |                       |
| Filter by Organization: | ۲ |         |       |                       |
| Organization            |   | Systems | Users | Trusts                |
| SUSE *                  |   | 6       | 1     | 0                     |

If you click the name of an organization, the Organization Details page appears.

### 18.2.1 Organizations > Organization Details

The Organization > Organization Details page lists the details of the selected organization.

| etails Users Trusts Cor    | figuration States                        |
|----------------------------|--|
| rganization Details        |  |
| Organization Name:         | SUSE<br>Tip:Between 3 and 128 characters |
| Organization ID:           | 1  |
| Active Users:              | <del>알</del> 1                           |
| Systems:                   | 6  |
| System Groups:             | 0  |
| Activation Keys:           | 1  |
| Autoinstallation Profiles: | 0  |
| Configuration Channels:    | 2  |
|                            | Update Organization                      |

The following details are available:

- *Organization Details* > *Organization Name* : String (between 3 and 128 characters). This is the only value that you can change here. When done, confirm with clicking the *Update Organization* button.
- Organization Details > Organization ID : Number
- Organization Details > Active Users : Number. Clicking this number will open the Organization Details > Users tab.
- Organization Details > Systems : Number
- Organization Details > System Groups : Number
- Organization Details > Activation Keys : Number
- Organization Details > Autoinstallation Profiles : Number
- Organization Details > Configuration Channels : Number

### 18.2.2 Organization Details > Users

List of all the users of an organization.

| Details Use       | rs Trusts                | Configuration State | S   |   |
|-------------------|--------------------------|---------------------|---|---|
|                   | st of all users in the s |                     | at you will only have access to modify the details of these t | isers if you are logged into the SUSE organizatio |
| Filter by Usernar | ne:                      | ۲                   |   |   |
| Jsername          | Email                    |                     | Real Name   | Org Admin?*                                       |
|                   |                          | se@suse.de          | Administrator, Administrator                                  | <i></i>   |

You can modify the user details if you belong to that organization and have organization administrator privileges.

### 18.2.3 Organization Details > Trust

Here establish trust between organizations.

| Details     | Users       | Trusts | Configuration | States |    |       |  |
|-------------|-------------|--------|---------------|--------|----|-------|--|
|             |             |        |               |        |    |       |  |
| Organizatio | n           |        |               |        | Tr | rusts |  |
| •           |             |        |               |        |    |       |  |
| No Other O  | ganizations | 5      |               |        |    |       |  |
| No Other O  | ganization  | 5      |               |        |    |       |  |

Such a trust allows sharing contents and migrate systems between these two organizations. You may add a trust by checking the box next to an organization (or remove a trust by unchecking it) and clicking the *Modify Trusts* button.

### 18.2.4 Organization Details > Configuration

Allow the Organization Administrator to manage Organization configuration, configure the organization to use staged contents ("pre-fetching" packages, etc.), set up software crash reporting, and upload of SCAP files.

| Details Users Trusts Cor   | nfiguration States   |
|--|--|
| SUSE Manager Configuration   |  |
| As SUSE Manager Admin you can configu<br>huge impact on the SUSE Manager perfor  | rre, whether Organization Administrators may configure Organization Configuration. Organizaton Configuration settings may have<br>mance. |
| Allow Organization Admin to manage<br>Organization Configuration                 | ₽  |
| Organization Configuration   |  |
| Below you configure your organization to<br>means no limit) and SCAP settings.   | use staging content, errata e-mail notifications, software crash reporting (Crash file upload limit is a non negative number, zero       |
| Enable Staging Contents  | c  |
| Enable Errata E-mail Notifications (for<br>users belonging to this organization) | ⊽  |
| Enable Software Crash Reporting  | ₽<br>₽   |
| Enable Upload Of Crash Files   | ₽<br>₽   |
| Crash File Upload Size Limit:  | 2048   |
| Enable Upload Of Detailed SCAP Files   | D  |
| SCAP File Upload Size Limit:   | 2097152  |
| Allow Deletion of SCAP Results   | ⊽  |
| Allow Deletion After (period in days):   | 90   |
|  |  |

### **SUSE Manager Configuration**

Enable SUSE Manager Configuration > Allow Organization Admin to manage Organization Configuration if desired.

#### **Organization Configuration**

- Organization Configuration > Enable Staging Contents
- Organization Configuration > Enable Errata E-mail Notifications (for users belonging to this organization)
- Organization Configuration > Enable Software Crash Reporting
- Organization Configuration > Enable Upload Of Crash Files
- Organization Configuration > Crash File Upload Size Limit
- Organization Configuration > Enable Upload Of Detailed SCAP Files
- Organization Configuration > SCAP File Upload Size Limit

- Organization Configuration > Allow Deletion of SCAP Results
- Organization Configuration > Allow Deletion After (period in days)

When settings are done, confirm with clicking the *Update Organization* button.

### **Enable Staging Contents**

The clients will download packages in advance and stage them. This has the advantage that the package installation action will take place immediately, when the schedule is actually executed. This "pre-fetching" saves maintenance window time, which is good for service uptime.

For staging contents ("pre-fetching"), edit on the client /etc/sysconfig/rhn/up2date:

stagingContent=1
stagingContentWindow=24

stagingContentWindow is a time value expressed in hours and determines when downloading will start. It is the number of hours before the scheduled installation or update time. In this case, it means 24 hours before the installation time. The start time for download depends on the selected contact method for a system. The assigned contact method sets the time for when the next rhn\_check will be executed.

Next time an action is scheduled, packages will automatically be downloaded but not installed yet. When the scheduled time comes, the action will use the staged version.

### **Minion Content Staging**

Every Organization administrator can enable Content Staging from the Organization configuration page *Admin* > *Organization* > *OrgName* > *Configuration* > *Enable Staging Contents*.

Staging content for minions is affected by two parameters.

- <u>salt\_content\_staging\_advance</u>: expresses the advance time, in hours, for the content staging window to open with regard to the scheduled installation/upgrade time.
- <u>salt\_content\_staging\_window</u>: expresses the duration, in hours, of the time window for Salt minions to stage packages in advance of scheduled installations or upgrades.

A value of **salt\_content\_staging\_advance** equal to **salt\_content\_staging\_window** results in the content staging window closing exactly when the installation/upgrade is scheduled to be executed. A larger value allows separating download time from the installation time.

These options are configured in <u>/usr/share/rhn/config-defaults/rhn\_java.conf</u> and by default assume the following values:

- salt\_content\_staging\_advance: 8 hours
- salt\_content\_staging\_window: 8 hours

### Note

These parameters will only have an effect when Content Staging is enabled for the targeted Organization.

### 18.2.5 Organization Details > States

From the *Admin* > *Organizations* > *States* page you can assign State to all systems in an organization. For example, this way it is possible to define a few global security policies or add a common admin user to all machines.

| ails Users Trusts Cor  | figuration States                |                                   |
|------------------------|----------------------------------|-----------------------------------|
| Configuration Channels |                                  |                                   |
|                        |                                  |                                   |
|                        |                                  |                                   |
| Configuration Channe   | IS                               |                                   |
| Configuration Channe   | IS                               |                                   |
| Configuration Channe   | IS                               | Apply                             |
| Configuration Channe   | IS                               | Apply                             |
| Configuration Channe   | Search in configuration channels | Apply<br>Search System No Changes |

# 18.3 Main Menu > Admin > Users

To view and manage all users of the organization you are currently logged in to, click *Main Menu* > *Admin* > *Users* in the left navigation bar. The table lists user name, real name, organization and whether the user is organization or Uyuni administrator. To modify administrator privileges, click any user name with administrator privileges to get to the *Users* > *Users Details* page. For more information, see: *Section 17.1.4, "*User Details".

# 18.4 Main Menu > Admin > Manager Configuration

The *Main Menu* > *Admin* > *Manager Configuration* page is split into tabs which allow you to configure many aspects of Uyuni.

### 18.4.1 *Manager Configuration > General*

This page allows you to adjust basic Uyuni administration settings.

| <ul> <li>SUSE Manager Con</li> </ul> | figuration - General Configuration 🍳  |  |  |  |  |  |
|--------------------------------------|---|--|--|--|--|--|
|                                      | ne HTTP proxy settings are for the communication with a SUSE Manager parent server, if there is any. The HTTP proxy should be of<br>3080 will be used if none is explicitly provided. HTTP proxy settings for client systems to connect to this SUSE Manager can be |  |  |  |  |  |

| SUSE Manager Configuration           |   |  |  |  |  |  |
| Administrator Email Address*         | galaxy-noise@suse.de  |  |  |  |  |  |
| SUSE Manager Hostname*               | doc-server.tf.local   |  |  |  |  |  |
| HTTP proxy                           |   |  |  |  |  |  |
| HTTP proxy username                  |   |  |  |  |  |  |
| HTTP proxy password                  |   |  |  |  |  |  |
| Confirm HTTP proxy password          |   |  |  |  |  |  |
| RPM repository mount point           | /var/spacewalk  |  |  |  |  |  |
| Default To SSL                       | r.  |  |  |  |  |  |
|                                      | Update  |  |  |  |  |  |
|                                      |   |  |  |  |  |  |

### Administrator Email Address

E-mail address of the Uyuni administrator.

#### SUSE Manager Hostname

Host name of the Uyuni server.

#### Uyuni Proxy Configuration

Configure proxy data via the following fields:

- Manager Configuration > HTTP proxy
- Manager Configuration > HTTP proxy username
- Manager Configuration > HTTP proxy password
- Manager Configuration > Confirm HTTP proxy password

The HTTP proxy settings are for the communication with a Uyuni parent server, if there is any. The HTTP proxy should be of the form: <u>hostname:port</u>; the default port <u>8080</u> will be used if none is explicitly provided. HTTP proxy settings for client systems to connect to this Uyuni can be different, and will be configured separately, for example via: *Section 18.4.2, "Manager Configuration > Bootstrap Script"*.

### RPM repository mount point

The directory where RPM packages are mirrored. By default: /var/spacewalk.

### Default To SSL

For secure communication, use SSL.

When done, confirm with Update.

### 18.4.2 Manager Configuration > Bootstrap Script

The *Manager Configuration* > *Bootstrap Script* page allows you to generate a bootstrap script that registers the client systems with Uyuni and disconnects them from the remote SUSE Customer Center.

### Important: SLES 15 and Python 3

SLES 15 utilizes Python 3 as its default system version. Due to this change any older bootstrap scripts(based on python 2) must be re-created for SLES 15 systems. Attempting to register SLES 15 systems with SUSE Manager using Python 2 versions of the bootstrap script will fail.

| <ul> <li>SUSE Manager Con</li> </ul>   | figuration - Bootstrap 🔮   |  |  |  |  |  |  |
|--|--|--|--|--|--|--|--|
| The following information will be used to gen<br>Once the bootstrap scripts have been genera | erate bootstrap scripts. These bootstrap scripts can be used to configure a client to use this SUSE Manager to receive updates.<br>ted, they will be available from this server. |  |  |  |  |  |  |
| Please note that some manual configuration<br>/srv/www/htdocs/pub/bootstrap                  | of these scripts may still be required. The bootstrap script can be found on the SUSE Manager Server's filesystem here:  |  |  |  |  |  |  |
| General Bootstrap Script Orga  | nizations Restart Cobbler Bare-metal systems   |  |  |  |  |  |  |
| Client Bootstrap Script Configuration  |  |  |  |  |  |  |  |
| SUSE Manager server hostname*  | doc-server.tf.local  |  |  |  |  |  |  |
| SSL cert location*   | /srv/www/htdocs/pub/rhn-org-trusted-ssl-cert-1.0-1.noarch.rpm  |  |  |  |  |  |  |
| Bootstrap using Salt   | Γ <b>ν</b>   |  |  |  |  |  |  |
| Enable SSL   | l⊽   |  |  |  |  |  |  |
| Enable Client GPG checking   | ī⊋   |  |  |  |  |  |  |
| Enable Remote Configuration  | D  |  |  |  |  |  |  |
| Enable Remote Commands   | D  |  |  |  |  |  |  |
| Client HTTP Proxy  |  |  |  |  |  |  |  |
| Client HTTP Proxy username   |  |  |  |  |  |  |  |
| Client HTTP Proxy password   |  |  |  |  |  |  |  |
|  | Update   |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |

This generated script will be placed within the <u>/srv/www/htdocs/pub/bootstrap/</u> directory on your Uyuni server. The bootstrap script will significantly reduce the effort involved in reconfiguring all systems, which by default obtain packages from the SUSE Customer Center. The required fields are pre-populated with values derived from previous installation steps. Ensure this information is accurate.

### SUSE Manager server hostname

The name of the SUSE Manager server where you want to register the client (pre-populated).

#### SSL cert location

Location and name of the SSL certificate (pre-populated).

### Bootstrap using Salt

To bootstrap traditional clients, uncheck *Client Bootstrap Script Configuration* > *Bootstrap using Salt*. For more information, see: *Book "Getting Started", Chapter 5 "Registering Clients", Section 5.4 "Registering Traditional Clients".* 

### Enable SSL

It is advised keeping SSL enabled. If enabled the corporate public CA certificate will be installed on the client. If disabled the user must manage CA certificates to be able to run the registration (rhnreg\_ks).

### **Enable Client GPG checking**

GNU Privacy Guard (GPG)

### **Enable Remote Configuration**

Enable remote configuration management and remote command acceptance of the systems to be bootstrapped to the Uyuni. Both features are useful for completing client configuration. For more information, see: *Chapter 15, Configuration* and *Section 7.3.1.3, "System Details > Details > Remote Command"*.

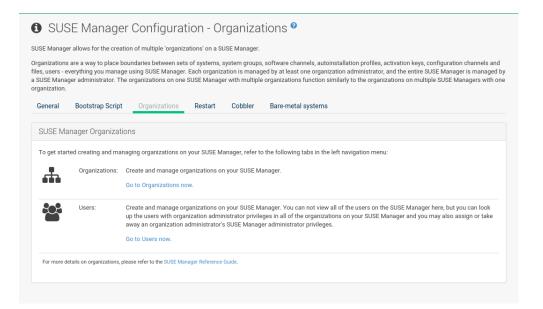

### **Client HTTP Proxy**

Client HTTP proxy settings if you are using an HTTP proxy server.

When finished, click *Update*.

### 18.4.3 *Manager Configuration > Organizations*

The *Manager Configuration* > *Organizations* page contains details about the organizations feature of Uyuni, and links for creating and configuring organizations.

### 18.4.4 Manager Configuration > Restart

The *Manager Configuration* > *Restart* page comprises the final step in configuring Uyuni.

| <b>1</b> SUS | SE Manager                 | Configurat    | tion - Re | estart Ø |   |
|--------------|----------------------------|---------------|-----------|----------|---|
|              |                            |               |           |          | to restart the SUSE Manager. This page will auto refresh in 4 minutes. Be aware that this<br>ter or interact with the SUSE Manager. |
| General      | Bootstrap Script           | Organizations | Restart   | Cobbler  | Bare-metal systems  |
| Restart S    | SUSE Manager               |               |           |          |   |
|              | Restart SUSE D<br>Manager? |               |           |          |   |
|              |                            | Restart       |           |          |   |

Click the *Restart* button to restart Uyuni and incorporate all of the configuration options added on the previous screens. It will take between four and five minutes for a restart to finish.

### 18.4.5 Manager Configuration > Cobbler

On the *Manager Configuration* > *Cobbler* page you can run the Cobbler synchronization by clicking *Update*.

| SUSE Manager Configuration - Cobbler. |  |                  |         |         |                    |  |
|---------------------------------------|--|------------------|---------|---------|--------------------|--|
| Setup your SU                         | Setup your SUSE Manager Cobbler settings below.  |                  |         |         |                    |  |
| Cobbler sync                          | Cobbler sync is used to repair or rebuild the contents /srv/tftpboot or /srv/www/cobbler when manual modification of cobbler has occurred. |                  |         |         |                    |  |
| For more info                         | rmation refer to the 'col  | obler' man page. |         |         |                    |  |
| General                               | Bootstrap Script   | Organizations    | Restart | Cobbler | Bare-metal systems |  |
| Run Cobbler Sync                      |  |                  |         |         |                    |  |
| Run Cobbler Sync Update               |  |                  |         |         |                    |  |

Cobbler synchronization is used to repair or rebuild the contents of /srv/tftpboot or /srv/www/cobbler when a manual modification of the cobbler setup has occurred.

### 18.4.6 Manager Configuration > Bare-metal systems

Here you can add unprovisioned ("bare-metal") systems capable of booting using PXE to an organization.

| SUSE Manager Configuration - Bare-metal systems <sup>2</sup>   |                  |               |         |         |                    |
|--|------------------|---------------|---------|---------|--------------------|
| Allows SUSE Manager to automatically add bare-metal systems capable of PXE booting to an organization. |                  |               |         |         |                    |
| General E  | Bootstrap Script | Organizations | Restart | Cobbler | Bare-metal systems |
| Bare-metal system management   |                  |               |         |         |                    |
| Bare-metal systems Enable adding to this organization  |                  |               |         |         |                    |

First click *Enable adding to this organization*. Those systems then will appear in the *Main Menu* > *Systems* > *All Systems* list, where regular provisioning via autoinstallation is possible in a completely unattended fashion.

Only AMD64/Intel 64 systems with at least 1 GB of RAM are supported. Uyuni server will use its integrated Cobbler instance and will act as TFTP server for this feature to work, so the network segment that connects it to target systems must be properly configured. In particular, a DHCP server must exist and have a next-server configuration parameter set to the Uyuni server IP address or hostname.

When enabled, any bare-metal system connected to the SUSE Manager server network will be automatically added to the organization when it powers on. The process typically takes a few minutes; when it finishes, the system will automatically shut down and then appear in the *Main Menu* > *Systems* > *All Systems* list.

### Note

New systems will be added to the organization of the administrator who enabled this feature. To change the organization, disable the feature, log in as an administrator of a different organization and enable it again.

Provisioning can be initiated by clicking the *Provisioning* tab. In case of bare-metal systems, though, provisioning cannot be scheduled, it will happen automatically when it is completely configured and the system is powered on.

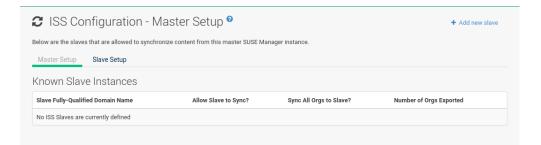

It is possible to use *Main Menu* > *Systems* > *System Set Manager* with bare-metal systems, although in that case some features will not be available as those systems do not have an operating system installed. This limitation also applies to mixed sets with regular and bare-metal systems: full features will be enabled again when all bare-metal systems are removed from the set.

# 18.5 Main Menu > Admin > ISS Configuration

Inter-Server Synchronization (ISS) allows Uyuni synchronizing content and permissions from another Uyuni instance in a peer-to-peer relationship.

### 18.5.1 Configuring the Master Uyuni Server

The following will help you set up a master ISS server.

Click *Admin* > > *ISS Configuration* > *Master Setup*. In the top right-hand corner of this page, click *Add New Slave*:

| ISS Configuration - Update Slave            |   |  |  |  |  |  |
|---|---|--|--|--|--|--|
| Update the details of the slave selected be | Update the details of the slave selected below. |  |  |  |  |  |
| Master Setup Slave Setup                    |   |  |  |  |  |  |
| Edit Slave Details                          |   |  |  |  |  |  |
| Slave Fully-Qualified Domain Name*          |   |  |  |  |  |  |
|   | Allow Slave to Sync?                            |  |  |  |  |  |
|   | Sync All Orgs to Slave?                         |  |  |  |  |  |
|   | Create  |  |  |  |  |  |
|   |   |  |  |  |  |  |

Fill in the following information:

- Slave Fully Qualified Domain Name (FQDN)
- Allow Slave to Sync? Selecting this checkbox will allow the slave Uyuni to access this master Uyuni. Otherwise, contact with this slave will be denied.
- Sync All Orgs to Slave? Checking this field will synchronize all organizations to the slave Uyuni.

### Note

Marking the ISS Configuration > Sync All Orgs to Slave? checkbox on the ISS Configuration > Master Setup page will override any specifically selected organizations in the local organization table.

Click Create. Optionally, click any local organization to be exported to the slave Uyuni then click Allow Orgs.

### Note: Enabling Inter-server Synchronization in Uyuni 2.1

ISS is enabled by default in Uyuni 3.1 and later.

To enable the inter-server synchronization (ISS) feature in Uyuni 2.1, edit the /etc/rhn/ rhn.conf file and set: disable\_iss=0. Save the file and restart the httpd service with service httpd restart.

For synchronization timeout settings, see: Book "Best Practices", Chapter 17 "Troubleshooting", Section 17.4 "RPC Connection Timeout Settings".

#### **Configuring Slave Servers** 18.5.2

Slave servers receive content synchronized from the master server.

| € ISS Configuration - Slave Set   | + Add new master |            |               |  |
|---|------------------|------------|---------------|--|
| Below are all the master SUSE Manager instances that this slave SUSE Manager instance has ever synchronized content from. |                  |            |               |  |
| Master Setup Slave Setup  |                  |            |               |  |
| Known Master Instances  |                  |            |               |  |
| Master Fully-Qualified Domain Name  | Default Master?  | Known Orgs | Unmapped Orgs |  |
| No Masters known to this Slave  |                  |            |               |  |
|   |                  |            |               |  |

To securely transfer content to the slave servers, the ORG-SSL certificate from the master server is needed. Click Admin > ISS Configuration > Slave Setup. In the top right-hand corner, click Add New Master.

| ISS Configuration - Update Master           |   |  |  |  |  |
|---|---|--|--|--|--|
| Update the details of the master selected b | ełow  |  |  |  |  |
| Master Setup Slave Setup                    |   |  |  |  |  |
| Details for new Master                      |   |  |  |  |  |
| Master Fully-Qualified Domain Name*:        |   |  |  |  |  |
| Filename of this Master's CA<br>Certificate | Note that this is the absolute path on the file system of this SUSE Manager |  |  |  |  |
|   | Default Master?   |  |  |  |  |
|   | Add new master  |  |  |  |  |

ISS Configuration > Update Master > Master Setup and fill in the following information:

- Master Fully Qualified Domain Name (FQDN)
- Filename of this Master's CA Certificate: use the full path to the CA Certificate. For example:

/etc/pki/trust/anchors

• Default Master?

Click *Add New Master*. Once the master and slave servers are configured, start the synchronization on the Master server by executing mgr-inter-sync:

mgr-inter-sync -c`YOUR-CHANNEL`

# 18.5.3 Mapping Uyuni Master Server Organizations to Slave Organizations

A mapping between organizational names on the master Uyuni allows for channel access permissions being set on the master server and propagated when content is synchronized to a slave Uyuni. Not all organization and channel details need to be mapped for all slaves. Uyuni administrators can select which permissions and organizations can be synchronized by allowing or omitting mappings.

To complete the mapping, log in to the Slave Uyuni as administrator. Click *Admin* > *ISS Configuration* > *Slave Setup* and select a master Uyuni by clicking its name. Use the drop-down box to map the exported master organization name to a matching local organization in the slave Uyuni, then click *Update Mapping*.

On the command line, issue the synchronization command on each of the custom channels to obtain the correct trust structure and channel permissions:

mgr-inter-sync -c`YOUR-CHANNEL`

# 18.6 Main Menu > Admin > Task Schedules

Under Main Menu > Admin > Task Schedules all predefined task bunches are listed.

| SUSE Manager So<br>low is a list of defined schedules. A sch |                | ften a predefined bunch shall be triggered. | + create schedule           |
|--|----------------|---|-----------------------------|
| 1 - 23 of 23   |                |   |                             |
|  |                |   | 25 - Items per page         |
| Schedule name <u>ji</u>                                      | Frequency      | Active From                                 | Bunch                       |

Click a *SUSE Manager Schedules > Schedule name* to open its *Schedule Name > Basic Schedule Details* where you can disable it or change the frequency. Click *Edit Schedule* to update the schedule with your settings. To delete a schedule, click *delete schedule* in the upper right-hand corner.

### Warning

Only disable or delete a schedule if you are absolutely certain this is necessary as they are essential for Uyuni to work properly.

If you click a bunch name, a list of runs of that bunch type and their status will be displayed. Clicking the start time links takes you back to the *Schedule Name* > *Basic Schedule Details*.

For example, the following predefined task bunches are scheduled by default and can be configured:

### channel-repodata-default:

(Re)generates repository metadata files.

### cleanup-data-default:

Cleans up stale package change log and monitoring time series data from the database.

### clear-taskologs-default:

Clears task engine (taskomatic) history data older than a specified number of days, depending on the job type, from the database.

### cobbler-sync-default:

Synchronizes distribution and profile data from Uyuni to Cobbler. For more information on Cobbler, see *Book "Advanced Topics", Chapter 10 "Cobbler"*.

### compare-configs-default:

Compares configuration files as stored in configuration channels with the files stored on all configuration-enabled servers. To review comparisons, click the *Main Menu* > *Systems* tab and click the system of interest. Go to *Configuration* > *Compare Files*. For more information, refer to: *Section* 7.3.3.5, *"System Details* > *Configuration* > *Compare Files"*.

### cve-server-channels-default:

Updates internal pre-computed CVE data that is used to display results on the *Main Menu* > *Audit* > *CVE Audit* page. Search results in the *Main Menu* > *Audit* > *CVE Audit* page are updated to the last run of this schedule). For more information, see: *Section* 13.1, "CVE Audit".

### daily-status-default:

Sends daily report e-mails to relevant addresses. To learn more about how to configure notifications for specific users, see: *Section 17.1.4.5, "User Details > Preferences"* 

### errata-cache-default:

Updates internal patch cache database tables, which are used to look up packages that need updates for each server. Also, this sends notification emails to users that might be interested in certain patches. For more information on patches, see: *Chapter 11, Patches*.

#### errata-queue-default:

Queues automatic updates (patches) for servers that are configured to receive them.

### kickstart-cleanup-default:

Cleans up stale kickstart session data.

#### kickstartfile-sync-default:

Generates Cobbler files corresponding to Kickstart profiles created by the configuration wizard.

#### mgr-register-default:

Calls the <u>mgr-register</u> command, which synchronizes client registration data with NCC (new, changed or deleted clients' data are forwarded).

### mgr-sync-refresh-default:

the default time at which the start of synchronization with SUSE Customer Center (SCC) takes place (mgr-sync-refresh).

#### package-cleanup-default:

deletes stale package files from the file system.

#### reboot-action-cleanup-default:

any reboot actions pending for more than six hours are marked as failed and associated data is cleaned up in the database. For more information on scheduling reboot actions, see: *Section 7.3.4.2, "System Details > Provisioning > Power Management"*.

#### sandbox-cleanup-default:

cleans up sandbox > ] configuration files and channels that are older than the menu:sandbox\_lifetime[ configuration parameter (3 days by default). Sandbox files are those imported from systems or files under development. For more information, see: Section 7.3.3.3, "System Details > Configuration > Add Files"

#### session-cleanup-default:

cleans up stale Web interface sessions, typically data that is temporarily stored when a user logs in and then closes the browser before logging out.

#### ssh-push-default:

prompts clients to check in with Uyuni via SSH if they are configured with a *Contact Method* > *SSH Push*.

### token-cleanup-default:

deletes expired repository tokens that are used by Salt minions to download packages and metadata.

# 18.7 Main Menu > Admin > Task Engine Status

This is a status report of the various tasks running by the Uyuni task engine.

| st Execution Times Runtime Status                     |                                    |          |
|---|------------------------------------|----------|

# 19 Help

The *Main Menu* > *Help* pages provide access to the full suite of documentation and support available to Uyuni users.

# 19.1 Uyuni Getting Started Guide

In *Book "Getting Started"* find information regarding Uyuni server and its installation and initial configuration. Implementing a fully functional Uyuni requires more than installing software and a database. Client systems must be configured to use Uyuni. Custom packages and channels should be created for optimal use. Since these tasks extend beyond the basic installation, they are covered in detail in the other guides.

# 19.2 Uyuni Reference Guide

Reference Manual explains the Web interface and its features in detail.

# 19.3 Uyuni Best Practices Guide

*Book "Best Practices"* describes SUSE recommended best practices for Uyuni. This information has been collected from many successful Uyuni real world implementations and includes feedback provided by product management, sales, and engineering.

# 19.4 Uyuni Advanced Topics Guide

*Book "Advanced Topics"* contains a collection of advanced topics not covered under the best practices guide.

# 19.5 Release Notes

The *Main Menu* > *Help* > *Release Notes* page lists the notes accompanying every recent release of Uyuni. All significant changes in a given release cycle, from major enhancements to the user interface to changes in the related documentation are documented here.

# 19.6 API

Documentation for using the Application Programming Interface (API) for creating tools and programs to automate common tasks via Uyuni.

The *Main Menu* > *Help* > *API* page contains an overview of the API, with links to detailed descriptions of various API calls available to administrators and developers. There is also an *Main Menu* > *Help* > *API* > *FAQ* page for answers to common questions about the Uyuni API. A *Main Menu* > *Help* > *API* > *Sample Scripts* page shows example code using API calls.

# 19.7 Search

The *Main Menu* > *Help* > *Search* page features a robust search engine that indexes and searches Uyuni documentation.

| <b>Q</b> Document Se   | earch <sup>©</sup> |  |  |  |  |
|--|--------------------|--|--|--|--|
| Document Search will return links to pages matching your search term.<br>Specify your search criteria below. |                    |  |  |  |  |
| Search For:  |                    |  |  |  |  |
| What to search:  | Content & Title    |  |  |  |  |
|  | Q Search           |  |  |  |  |
|  |                    |  |  |  |  |

FIGURE 19.1: DOCUMENT SEARCH

Users can search the available online documentation and filter them according to the following choices in the What to Search drop-down box:

- <u>Content & Title</u> Search both the title heading or body content of all available documents.
- Free Form Search documents for any keyword matches, which broadens search results.
- Content Search only the body content of documentation for more specific matches.
- <u>Title</u> Search only the title headings of the documentation for targeted, specific search results.

The <u>Free Form</u> field additionally allows you to search using field names that you prepend to search queries and filter results in that field.

For example, if you wanted to search all of the Uyuni manuals for the word Virtualization in the title and install in the content, type the following in the Free Form field:

title:Virtualization and content:install

Other supported field names for documentation search include:

- url Search the URL for a particular keyword.
- title Search titles for a particular keyword.
- content Search the body of the documentation for a particular keyword.

If there are several pages of search results, you can limit the amount of visible results shown on one page by clicking the <u>Display quantity items per page</u> drop-down box, which offers between 10 and 500 results per page.

To move between pages, click the right or left angle brackets ( $\geq$  to go forward or  $\leq$  to go backward).
